* The required voltage will not differ from the quoted value by more than \pm 50%. † The beam is unblanked when $V_{\rm g2} = V_{\rm a1}$. This grid 2 electrode should not be used as a brilliance control.

Raster Distortion.

At the recommended P.D.A. ratios, over a screen area of 6 cm x 10 cm raster distortion will not be greater than 2%. Raster geometry can be adjusted by varying the interplate shield voltage (V_S) with respect to the mean deflector plate potential. The interplate shield voltage (V_S) for optimum raster shape will be within ± 50V of the mean deflector plate potential, though differing from the third anode voltage (V_{a3}). It is essential to ensure that the correct raster shape has been achieved by this means before adjusting for optimum focus.

For an 8 cm x.10 cm raster the corners will be cut to 120 mm minimum diameter.

Rectangularity of X and Y axes is 90° ± 10.

Typical Operation

The Deflector System

Both X and Y plates are designed for symmetrical operation. Should the tube be required to operate asymmetrically,, some degradation of focus and trace geometry will result.

If the mean plate potentials for both X and Y plates are the same, the third anode voltage for astigmatism correction will be within \pm 50V of the mean plate potential.

If the X plate mean potential differs considerably from that of the Y, greater variation of the third anode voltage (V_{a3}) and the interplate shield voltage (V_{s}) will be required, and the X and Y sensitivities will decrease.

The Y plate mean potential should not be allowed to become greater than that of the X or severe deflection defocusing will result.

The deflector system is designed to intercept part of the beam, so that low impedance deflector plate drive is desirable.

Magnetic Shielding

Adequate magnetic shielding is required. In addition due attention should be paid to the position of the tube relative to transformers and chokes.

Tube Weight (approx) - Net 21/4 lb (1.0 kg)

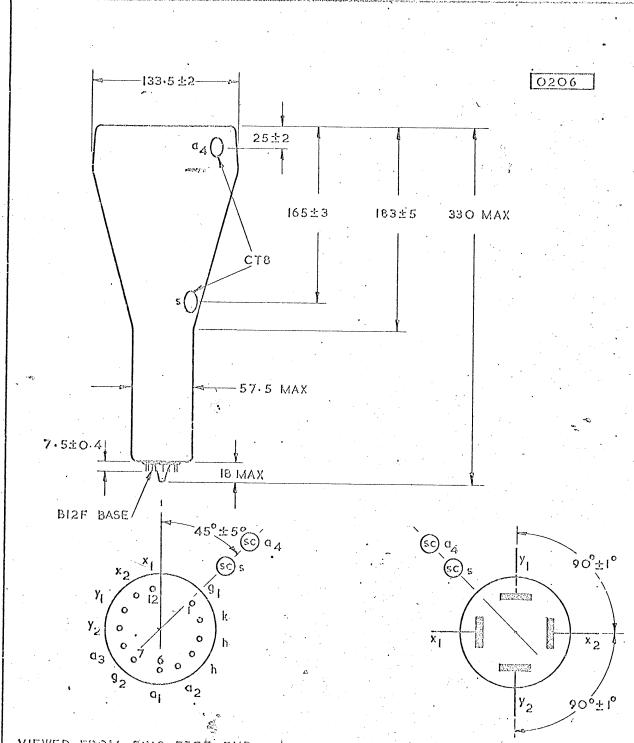

Applications Laboratory BRIMSDOWN, ENFIELD, MIDDLESEX.

Date:

21st June, 1966.

SUBJECT: Outline Drawing.

T.D.S.No. 6-SE5F-90-1A

VIEWED FROM PINS FREE END

VIEWED FROM SCREEN END PIN 6 AT BOTTOM

Mounting Position - Unrestricted

It is advisable to support the tube near the screen and at a second point on the parallel neck near the base. The tube should not be subjected to any stress from the use of clamps and should not be suspended by the base.

Connecting leads should not be soldered directly to the tube pins.

All dimensions in mm

Not to be scaled
