## NOTES

1. Not including graticule lighting hardware. See outline drawing.
2. See outline drawing. The socket for this tube should not be rigidly mounted. It should have flexible leads and be allowed to move freely so that it cannot impress lateral strains through the socket contacts onto the base pins.
3. All voltages taken with respect to cathode.
4. This tube is designed for optimum performance when operating at a ratio of 4.3. Operation at other ratios may result in changes in deflection uniformity, pattern distortion, and/or useful scan.
5. Pattern distortion is minimized by proper adjustment of this potential.
6. Recommended range. Adjust for best overall focus.
7. Visual extinction of undeflected spot.
8. Major graticule divisions are 8 mm.
9. The deflection plates intercept part of the electron beam near the edge of scan; therefore, a low-impedance deflection drive is desirable.
10. Connect free deflection electrodes to accelerator.
11. With a 8 x 10 div. rectangular raster centered on the face of the tube, the raster edges will not deviate from straight parallel lines by more than 0.5 minor div. total on the left and right edges, nor by more than 0.5 minor div. total at the top and bottom.
