OPERATORS SAFETY SUMMARY

The general safety information in this part of the summary is for both operating and servicing personnel. Specific warnings and cautions will be found throughout the manual where they apply, but may not appear in this summary.

TERMS

In This Manual

CAUTION statements identify conditions or practices that could result in damage to the equipment or other property.

WARNING statements identify conditions or practices that could result in personal injury or loss of life.

As Marked on Equipment

CAUTION indicates a personal injury hazard not immediately accessible as one reads the marking, or a hazard to property including the equipment itself.

DANGER indicates a personal injury hazard immediately accessible as one reads the marking.

SYMBOLS

In This Manual

This symbol indicates where applicable cautionary or other information is to be found.

As Marked on Equipment

DANGER — High voltage.

Protective ground (earth) terminal.

ATTENTION — refer to manual.

Power Source

This product is intended to operate from a power module connected to a power source that will not apply more than 250 volts rms between the supply conductors or between either supply conductor and ground. A protective ground connection by way of the grounding conductor in the power cord is essential for safe operation.

Grounding the Product

This product is grounded through the grounding conductor of the power module power cord. To avoid electrical shock, plug the power cord into a properly wired receptacle before connecting to the product input or output terminals. A protective ground connection by way of the grounding conductor in the power module power cord is essential for safe operation.

Danger Arising From Loss of Ground

Upon loss of the protective-ground connection, all accessible conductive parts (including knobs and controls that may appear to be insulating) can render an electric shock.

Use the Proper Fuse

To avoid fire hazard, use only the fuse of correct type, voltage rating and current rating as specified in the parts list for your product.

Refer fuse replacement to qualified service personnel.

Do Not Operate in Explosive Atmospheres

To avoid explosion, do not operate this product in an explosive atmosphere unless it has been specifically certified for such operation.

Do Not Operate Without Covers

To avoid personal injury, do not operate this product without covers or panels installed. Do not apply power to the plug-in via a plug-in extender.

Scan by Zenith

SERVICE SAFETY SUMMARY

FOR QUALIFIED SERVICE PERSONNEL ONLY

Refer also to the preceding Operators Safety Summary.

Do Not Service Alone

Do not perform internal service or adjustment of this product unless another person capable of rendering first aid and resuscitation is present.

Use Care When Servicing With Power On

Dangerous voltages may exist at several points in this product. To avoid personal injury, do not touch exposed connections and components while power is on.

Disconnect power before removing protective panels, soldering, or replacing components.

Power Source

This product is intended to operate in a power moduleconnected to a power source that will not apply more than 250 volts rms between the supply conductors or between either supply conductor and ground. A protective ground connection by way of the grounding conductor in the power cord is essential for safe operation.

PG 507 50 MHz Dual Output Pulse Generator.

Scan by Zenith

SPECIFICATION

Introduction

The TEKTRONIX PG 507 50 MHz Dual Output Pulse Generator is designed to operate in any two compartments of a TM 500-series power module. It is a general purpose, full function pulse generator, designed for digital logic applications.

Important features include dual simultaneous complementary pulse outputs with a maximum amplitude of 15 volts in a ±15 volt window from a low reactance 50 Ω source, 3.5 ns rise and fall times, and independent control of the high and low levels of the output pulse.

Front panel controls and connectors provide the capability to trigger or synchronously gate the PG 507 from an external signal with trigger/gate input level and slope controls. Delayed pulse, paired pulse, and manual trigger capabilities are included. Square-wave outputs and complementary rectangular pulse outputs can also be selected.

All inputs and outputs are internally terminated in 50 Ω except the trigger/gate input which is internally selectable for either 50 Ω or 1 MΩ, 20 pF input impedance. A control error warning light indicates incompatible control settings. Special positions on the period, duration, and delay controls permit customized control ranges.

The high and low level pulse amplitude controls are shared by both outputs, and a preset switch allows selection of adjustable preset output levels. Each of the outputs has an independent normal/complement switch.

The rear interface connector provides access to several internal signals and provides control lines that permit custom interconnecting of companion instruments.

Performance Conditions

The performance limits in this specification are valid with the following conditions:

1. The instrument must have been adjusted at an ambient temperature between +20°C and +30°C.

2. The instrument must be in a non-condensing environment whose limits are described under Environmental.

3. Allow thirty minutes warm-up time for operation to specified accuracy; sixty minutes after exposure to or storage in high humidity (condensing) environment.

Items listed in the Performance Requirements column of the Electrical Characteristics are verified by completing the Performance Check in the Calibration Section of this manual. Items listed in the Supplemental Information column are not verified in this manual. They are either explanatory notes or performance characteristics for which no limits are specified.

Scan by Zenith

Table 1-1

ELECTRICAL CHARACTERISTICS

Characteristics	Performance Requirements	Supplemental Information
PERIOD:		
Range	≤20 ns to ≥200 ms in seven decade steps plus variable, with overlap on all ranges.	Periods longer than 200 ms can be obtained in custom range position.
Jitter	≤0.1% +50 ps.	
DELAY or Time Between Leading Edges in Paired pulse mode.		
Range	≤10 ns to ≥100 ms in seven decade steps plus variable, with overlap on all ranges.	Delays longer than 100 ms can be obtained in custom range position.
Duty Factor	Delays to at least 70% for pulse periods of 0.2 μs to 20 ms, decreasing to at least 50% for a 20 ns period.	
Jitter	≤0.1% +50 ps.	
DURATION:		
Range	≤10 ns to ≥100 ms in seven decade steps plus variable, with overlap on all ranges.	Durations longer than 100 ms can be obtained in custom range position. An additional position provides duration of approximately 50% of the period setting for square-wave output. Output follows trigger input when in the EXT DUR mode.
Duty Factor	Pulse durations to at least 70% of pulse periods for periods of 0.2 μs to 20 ms, decreasing to at least 50% for a 20 ns period.	
Jitter	≤0.1% +50 ps.	
PULSE OUTPUTS:		
Amplitude	≥15 V p-p maximum into open circuit. ≤1 V p-p minimum into open circuit. ≥7.5 v p-p maximum into 50 Ω load. ≤0.5 V p-p minimum into 50 Ω load.	Dual simultaneous outputs each with an independent complement switch share the high and low level controls. Pulse high and low levels independently adjustable over a ±15 V range from a 50 Ω low reactance source. The preset level controls are adjustable over the same ranges.
Rise/Fall Time	≤3.5 ns fixed from 1 V to 5 V p-p into 50 Ω load. ≤4 ns fixed from 5 V to 7.5 V p-p into 50 Ω load.	
Aberrations (For signals ≥1 V p-p into a 50 Ω load.)	≤5% p-p +50 mV.	

Scan by Zenith

Table 1-1 (cont)

Characteristics	Performance Requirements	Supplemental Information
TRIGGER OUTPUTS:		
Amplitude	⩾+2 V squarewave.	
Source Impedance		50 Ω.
Duty Cycle		Internal triggering ≈50%. External triggering determined by duty cycle of triggering signal.
TRIGGER/GATE INPUT:		
Sensitivity	80 mV p-p to ⩾10 MHz; 250 mV p-p to 50 MHz at 50 Ω input impedance.	
Input Impedance		Internally selected, 50 Ω or 1 MΩ paralleled by ≈20 pF.
Maximum Input		±5 V peak into 50 Ω. ±20 V peak into 1 MΩ.
Minimum Input Pulse Width		10 ns.
Trigger Level:		
Range	⩾±3 V.	Adjustable.
Polarity		Front panel selectable, + or − slope.
TRIGGERED GATED LIGHT:		
Flashing		Input triggered at greater than ≈10 Hz repetition rate or following the input signal at slower repetition rates.
On (logic true)		TRIG/GATE IN input potential above TRIG/GATE LEVEL with + SLOPE selected or below TRIG/GATE LEVEL with − SLOPE selected.
OFF (logic false)		TRIG/GATE IN input potential below TRIG/GATE LEVEL with + SLOPE selected or above TRIG/GATE LEVEL with − SLOPE selected.
SYNCHRONOUS GATE		Rate generator starts synchronously with external gating signal and completes the last output pulse (or pulses in paired pulse mode) in progress at the end of the external gate signal.
PULSE DELAY MODES		Undelayed, delayed, and paired. Paired pulse mode limited to 25 MHz. Minimum pulse separation governed by duty factor specification.

Scan by Zenith

Table 1-1 (cont)

Characteristics	Performance Requirements	Supplemental Information
FIXED DELAYS		
+ TRIG OUT to Pulse out		≈35 ns internal duration, ≈23 ns EXT DUR or SQ WAVE mode.
TRIG/GATE IN to + TRIG OUT		≈25 ns.
CONTROL ERROR LIGHT		
Steady On		Indicates incompatible control settings. Output is undefined.
Flashing		Timing control settings selected do not properly define the output pulse because valid limits have been exceeded.
Steady Off		Indicates valid operation for most control settings.

Table 1-2

MISCELLANEOUS

Characteristics	Performance Requirements	Supplemental Information
Power Consumption		
Maximum		69.4 VA
Power Dissipation		
Maximum		28 W
Recommended Adjustment Interval		1000 hours or six months, whichever occurs first.
Warm-up Time		30 minutes.

OPERATING INSTRUCTIONS

INSTALLATION INSTRUCTIONS

Preparation for Use

The PG 507 50 MHz Dual Output Pulse Generator is calibrated and ready for use when received. It is a plug-in designed to operate in any two compartments of a TM 500 series power module. Refer to the power module instruction manual for line voltage requirements and power module operation. A list of standard accessories (and part numbers) is located in the back of this manual.

Several internal changes are available to modify the PG 507's capabilities. Each item is described in the Operators Familiarization part of this section of the manual. Refer all internal changes to qualified service personnel. Qualified service personnel see the Maintenance section of this manual for more information. The following is a list of items that are affected by these internal changes.

Front Panel Functions/Controls

PERIOD and DURATION controls. One range can be custom selected for each control.

DELAY control. One range can be custom selected.

TRIG/GATE IN. Input impedance selection.

+ TRIG OUT − Can be internally set for normal or complement trigger.

Rear Interface Signals

External Voltage Control.

Trig/Gate Input.

Trigger Output.

CAUTION

Turn the power module off before inserting or removing the plug-in to prevent damage to the plug-in circuitry.

Check to see that the plastic barriers on the interconnecting jack of the selected power module compartment match the cutouts in the PG 507 circuit board edge connector. Align the PG 507 chassis with the upper and lower guides (see Fig. 2-1) of the selected compartments. Push the PG 507 chassis in and press firmly to seat the circuit board edge connector in the interconnecting jack. Pull out the power switch on the power module. The PG 507 POWER indicator light on the front panel should light.

To remove the PG 507, turn off the power module and pull on the release latch (located in the lower left corner) until the interconnecting jack disengages and the PG 507 slides out.

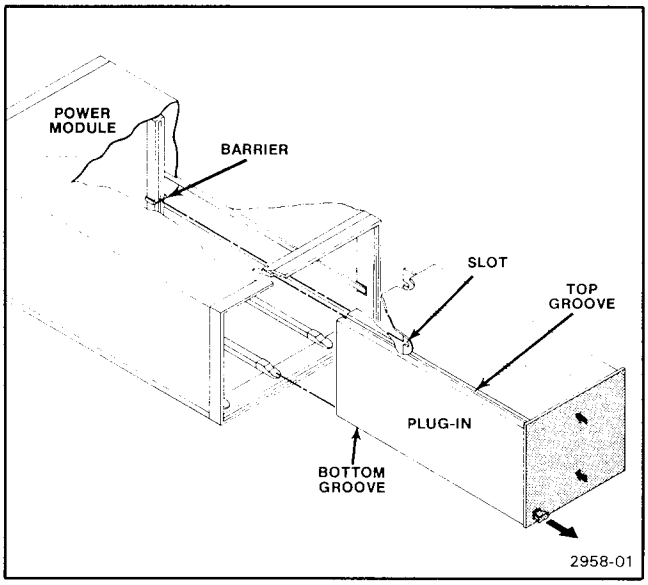

Fig. 2-1. PG 507 installation and removal.

CONTROLS AND CONNECTORS

TRIGGERING

(1) MAN Pushbutton

Push for manual trigger or gate.

(2) + SLOPE/ − SLOPE Pushbutton

Push for trigger or gate start on + slope; out for − slope start.

(3) SYNC GATE/FREE RUN Pushbutton

Button in for gated operation, out for free run.

(4) TRIG'D/GATE Indicator

Indicates when functioning in triggered or gated mode.

(5) TRIG/GATE LEVEL Control

Selects threshold level on trigger or gating waveform. Turn fully cw for manual trigger.

(6) TRIG/GATE IN Connector

Input connector for trigger or gate signals.

(7) + TRIG OUT Connector

Supplies positive-going waveform from the period generator for control of external circuitry.

MODE

(8) UNDLY Pushbutton

Push to disable DELAY function. Push with DLY button for paired pulses.

(9) DELAY Pushbutton

Push to enable DELAY function. Push with the UNDLY pushbutton for paired pulses.

TIMING

(10) PERIOD Control

Selects pulse period time.

(11) DELAY Control

Selects delay time.

(12) DURATION Control

Selects pulse duration time.

(13) CONTROL ERROR Indicator

Indicates improper control settings.

OUTPUT (Volts)

(14) HIGH LEVEL Control

Controls the pulse high level for both output signals in VARiable operation.

(15) LOW LEVEL Control

Controls the pulse low level for both output signals in VARiable operation.

(16) PRESET/VAR Pushbutton

Button out selects variable OUTPUT (VOLTS) HIGH LEVEL [14] and LOW LEVEL [15] controls for output amplitude selection; button in selects preset HIGH LEVEL [17] and LOW LEVEL [18] output amplitude.

(17) HIGH LEVEL Preset Control

Controls the pulse high level for both output signals in PRESET operation.

(18) LOW LEVEL Preset Control

Controls the pulse low level for both output signals in PRESET operation.

Scan by Zenith

(19) **OUTPUT A Connector**

Output A bnc connector.

(20) **COMPLEMENT (−) NORM (+) Pushbutton (Output A)**

Button out selects normal pulse at the OUTPUT A connector; button in provides the pulse complement.

(21) **OUTPUT B Connector**

Output B bnc connector.

(22) **COMPLEMENT (−) NORM (+) Pushbutton (Output B)**

Button out selects normal pulse at the OUTPUT B connector; button in provides the pulse complement.

(23) **Release Latch**

Pull to remove plug-in.

(24) **POWER Indicator**

Illuminates when power is applied via the power module.

Scan by Zenith

OPERATORS FAMILIARIZATION

Period and Duration Selection

For all PERIOD settings except EXT TRIG or MAN, the period generator operates at a rate set by the PERIOD range switch and variable control. The DURATION range switch and variable controls (except in the EXT DUR position) set the duration of the output pulses. When the DURATION control is set for a time greater than the PERIOD, the CONTROL ERROR lamp will light. When the DURATION control is set to the SQ WAVE position, the duration time is determined internally at approximately 50% of the period time. The blank range positions on the PERIOD and DURATION controls permit custom period and duration times. Refer custom range selection to qualified service personnel.

Duty Factors

Duty factors greater than those specified are obtainable on several ranges. When the duty factor is increased to the point that internal circuitry prevents completion of the pulse waveform, the CONTROL ERROR light will flash. To further increase the duty factor, switch to the complement mode. Set the DURATION control for a pulse width equal to the desired pulse off time and push the front panel COMPLEMENT (−) pushbutton.

Delayed and Paired Pulse Selection

In the pulse delay mode, the output pulse at each output connector is delayed from the + TRIG OUT signal by the DELAY time selected, plus a specified fixed delay. To use this feature, push the DELAY button and trigger the external device from the + TRIG OUT connector. Set the DELAY control for the desired delay time from trigger to pulse leading edge. Use the variable delay control labeled CAL for time adjustments between the delay time ranges.

Paired pulses are obtained at the output connectors by pushing both the DELAY and UNDLY buttons. The DELAY controls the time between the leading edges of the paired pulses for both output signals. An initial pulse occurs in the output signals at external trigger time, with the second or paired pulses delayed by the selected delay time.

The CONTROL ERROR light illuminates if the delay time is not compatible with the other pulse timing parameters. A custom range position on the DELAY control permits custom delay time selection. Refer custom range selection to qualified service personnel.

Output Levels

Amplitude and offset are selected for both output signals by independent LOW LEVEL and HIGH LEVEL controls. Use the front panel voltage calibration marks for an open circuit load. Divide the values by two for the specific output channel operating into a 50 Ω load. The OUTPUT (VOLTS) controls are electrically interlocked to prevent setting the HIGH LEVEL more negative than the LOW LEVEL. A clamp limits the output to 15 V peak-to-peak into an open circuit or 7.5 V into 50 Ω.

Pulse amplitude equals the pulse high level minus the pulse low level. Offset may be the high level or the low level, whichever is used as the base line reference level. The flexibility of this method is useful in certain applications such as logic testing. Either the high or low level can be varied without disturbing the other.

The pulse high and low levels can be preset. Push the PRESET button and adjust the HIGH LEVEL and the LOW LEVEL potentiometers with a screwdriver for the desired output levels.

External Triggering and Gating ⚠

The TRIG/GATE IN input impedance can be set for either 50 Ω or 1 MΩ by means of an internal switch. The PG 507 is shipped with the switch set for 50 Ω input impedance. Refer input impedance selection to qualified service personnel. In the 1 MΩ position the shunt capacitance is approximately 20 pF. A standard oscilloscope probe can be used to acquire the triggering signal from the external circuitry. If a compensated probe is used, calibrate the probe on the input of a 1 MΩ 20 pF oscilloscope first. A 10X probe allows triggering directly from high impedance sources such as MOS digital circuitry with an effective TRIG/GATE LEVEL range of ±30 V.

CAUTION

To avoid equipment damage, do not apply a voltage exceeding ±5 V peak with respect to chassis ground into 50 Ω or ±20 V peak into 1 MΩ to the TRIG/GATE IN connector.

For external gating select the desired period and duration. Press the SYNC GATE pushbutton. Select the desired trigger slope with the + or − SLOPE button. The OUTPUT now consists of pulses, described by the front panel controls, whenever the TRIG/GATE IN input exceeds the TRIG/GATE LEVEL control setting.

Scan by Zenith

To externally trigger the PG 507, connect the triggering signal to the TRIG/GATE IN connector. Select the slope on which triggering is desired with the + or − SLOPE button. Place the PERIOD switch in the EXT TRIG OR MAN position. Now adjust the TRIG/GATE LEVEL control for the desired triggering level. The output waveform begins about 46 ns after the triggering signal.

For external DURATION place the DURATION control in the EXT DUR position, and the PERIOD control in the EXT TRIG OR MAN position. The period and duration of the output waveform are now controlled by the triggering waveform. This is an extremely useful mode of operation for translating logic levels, etc. If the PERIOD is set for internal operation and the DURATION for external, the CONTROL ERROR light illuminates indicating an illegal mode of operation.

The TRIG'D/GATED indicator light functions as a TRIG/GATE level indicator. When the + SLOPE is selected and the external input level exceeds the threshold set by the TRIG/GATE LEVEL control, the light is on continuously. For input voltages below the threshold the light is continuously off. When the input passes through the threshold the light flashes. When the − SLOPE is selected the light behaves as for + SLOPE selection. However, the polarities are reversed.

The TRIG'D/GATED indicator light may be used as a logic level indicator for troubleshooting logic circuitry. Set the TRIG/GATE LEVEL control to a voltage equal to the midrange value of the logic voltage swing. If an attenuator probe is used for signal pickup, remember to consider the attenuation factor when setting the TRIG/GATE LEVEL voltage.

Trigger Output

The signal appearing at the connector is an approximate square wave. The leading edge (positive-going) precedes the output pulse by a specified fixed delay plus the delay as set by the DELAY control. In paired pulse operation, the leading edge precedes the first pulse by the fixed delay. The second pulse then appears after the set delay. A complement square wave (negative-going leading edge) is also available at the front panel by moving a connector on the timing circuit board. Refer internal connector changes to qualified service personnel.

Manual Trigger

To use this feature place the PERIOD switch in the EXT TRIG OR MAN position. Set the TRIG/GATE LEVEL control fully clockwise. If the + SLOPE is selected, the manual trigger will occur when the MAN button is depressed. If the − SLOPE is selected, the trigger occurs when the button is released. The manual trigger causes one output pulse, or a set of paired pulses if the DELAY and UNDLY buttons are depressed.

Control Error Light

The CONTROL ERROR light helps to solve setup problems by indicating most control errors. A steady glow indicates static control setting errors while a flashing light indicates dynamic errors. In either case, the control settings do not correctly indicate the output. Check the control settings for compatibility. See Table 2-1 for static control setting errors. Dynamic functions monitored are period, delay, and duration.

Rear Interface Signals

External Voltage Control. The output voltage high and low levels can be controlled via external control voltages applied to rear interface connector pins 22A and B. Before using this feature, internal adjustments must be made for the external control voltage supplied. Refer internal adjustment to qualified service personnel. To use this feature, depress the OUTPUT (VOLTS) PRESET pushbutton. The OUTPUT A and B voltage levels will vary linearly with the external control voltages (the output voltage high level is controlled by the external voltage applied to pin 22B and the low level by the voltage at 22A).

Amplitude Monitor. The front panel OUTPUT A and OUTPUT B signals are available at the rear interface Output A Amplitude Monitor (pin 24A) and the Output B Amplitude Monitor (pin 25A). Pin 26A is the Amplitude Monitor ground for these signals. The load for these signals must be >1 MΩ.

Trig/Gate Input. This signal may be applied to the rear interface connector instead of the front panel TRIG/GATE IN connector. To input the trigger/gate signal to the rear interface connector, an internal cable must be added to the instrument. Refer cable installation to qualified service personnel. With the cable installed, the trigger/gate signal is applied to rear interface connector pin 24B. Pin 25B is the trigger/gate input common.

Trigger Output. The trigger output signal is available at the rear interface connector pins 27B and 28B (common). This signal is the complement (180° out of phase) of the front panel + TRIG OUT signal. The rear interface trigger output may be used simultaneously with the front panel + TRIG OUT signal. Internal cable connections may be changed to route the normal trigger output to the rear interface connector and the trigger output complement to the + TRIG OUT connector. Refer cable connection changes to qualified service personnel.

Scan by Zenith

OPERATING CONSIDERATIONS

Output Terminations and Connections

The PG 507 operates as a voltage source in series with an internal 50 Ω impedance. Maximum pulse fidelity is obtained when the output operates into an external 50 Ω impedance. The output circuitry of the PG 507 is fully protected against any voltage transients when operating into passive loads.

Table 2-1 lists static control settings that illuminate the CONTROL ERROR light and their corresponding operating modes. Some of these modes may be useful.

If the load has a dc voltage across it, connect a blocking capacitor in series with the OUTPUT connector and the load. Make certain the time constant of the capacitor and load is large enough to maintain pulse top flatness.

Table 2-1

Static Control Setting Errors

Control Settings	Operation
EXT TRIG OR MAN and SYNC GATE	External Trigger Mode
EXT DUR and Internal Period	Square Wave Mode
EXT TRIG OR MAN and SQ WAVE (INT PERIOD)	External Duration Mode
SQ WAVE (INT PERIOD) and SYNC GATE	Truncated square wave when gate ends
SQ WAVE (INT PERIOD) and DELAY	No delay
EXT DUR and DELAY	No delay

Risetime Measurements in Linear Systems

Consider the rise and fall time of associated equipment when measuring the rise or fall time of a linear device. If the rise time of the device under test is at least ten times slower than the combined rise times of the PG 507, the monitoring oscilloscope, and associated cables, the error introduced will not exceed 1%, and usually may be ignored. If the rise or fall time of the test device is less than ten times slower than the combined rise times of the testing systems, determine the actual rise time of the device under test by using the following formula:

$$R_t = \sqrt{R^2_1 + R^2_2 + R^2_3 \ldots\ldots}$$

R_t equals the overall rise or fall time of the entire measurement system and R_1, R_2, R_3, etc., are the rise times or fall times of the individual components comprising the system.

Counted Burst Using the DD 501 Digital Delay Unit

This application permits preselecting the number of output pulses from the PG 507. The event is initiated by an externally applied signal or pulse, 5 ns or longer. The time duration of this signal or pulse has no effect on the output from the PG 507.

Before using this feature, internal changes must be made to the DD 501. Refer internal change to qualified service personnel. When these changes have been made, connect the PG 507 and the DD 501 as shown in Fig. 2-3. Use 10 inch (Tektronix Part Number 012-0208-00) or shorter cables for interconnecting the two units to reduce delays.

Initial Control Settings. Make certain the PG 507 TRIG/GATE IN input impedance is set for 50 Ω. Set the controls of the PG 507 for the desired output waveform with the PG 507 in FREE RUN. Do not use the SQ WAVE mode. Place the PG 507 in the + SLOPE, SYNC GATE mode and set the TRIG/GATE LEVEL control at the 2 o'clock position. Select EVENTS + SLOPE, START + SLOPE and place the EVENTS and START LEVEL controls at the 2 o'clock position on the DD 501. The three TRIG'D lights on the DD 501 and the TRIG'/GATED light on the PG 507 will be off until the DD 501 is triggered. Upon receipt of a trigger, all lights will illuminate. If not, check the setup and adjust the LEVEL controls as necessary.

Operation to 20 MHz. Set the EVENTS DELAY COUNT on the DD 501 for one less than the desired number of counts up to PG 507 repetition rate of about 20 MHz. See Fig. 2-4. If necessary, a single trigger may be obtained by rotating the DD 501 START LEVEL control through the 0 position, with no external trigger applied. A single trigger may also be obtained by using the TEKTRONIX manual (One Shot) Trigger Generator, Tektronix Part Number 016-0597-00. All other DD 601 and PG 507 operating controls function normally.

Operation from 20-50 MHz. Due to propagation delays in the PG 507, DD 501 and the interconnecting cables, one or more pulses, in addition to the desired number, are generated when the PG 507 repetition rates are set between 20 MHz and 50 MHz. These extra pulses are consistent for any frequency irrespective of the desired EVENTS DELAY COUNT setting. To determine the number of extra pulses for a given PG 507 period, set the

Scan by Zenith

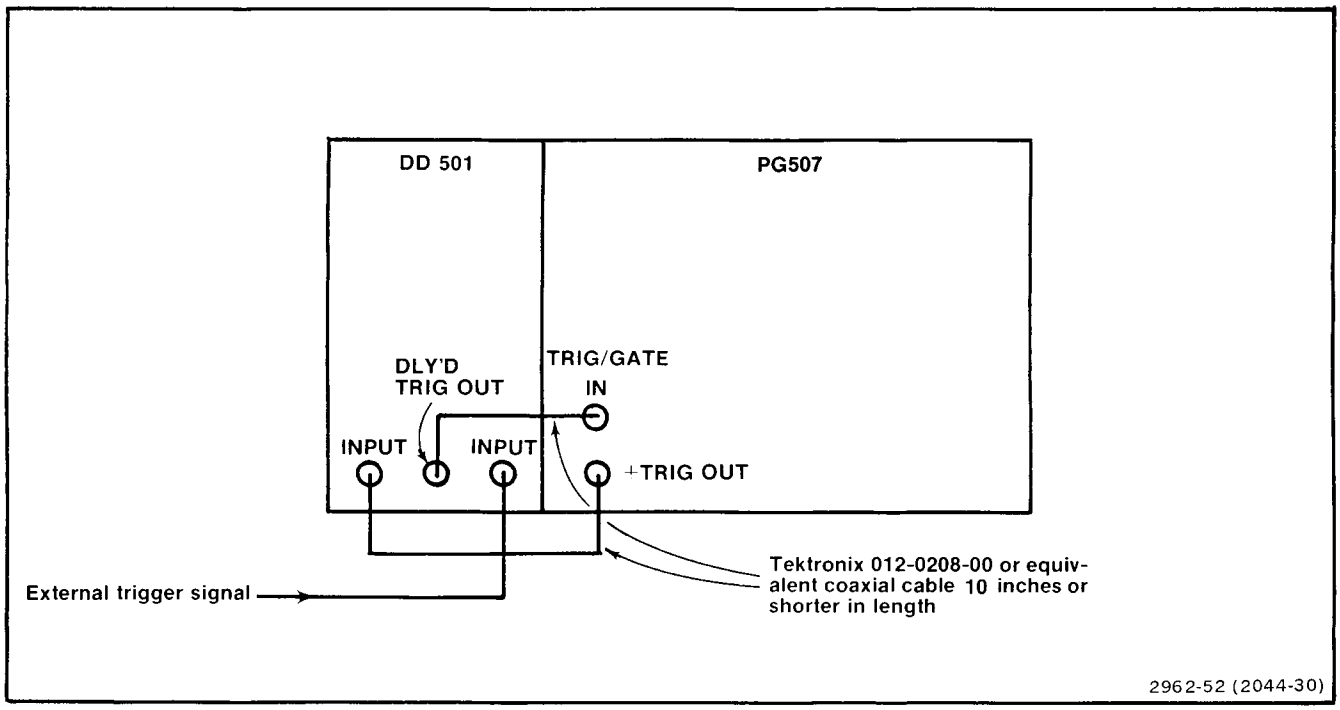

Fig. 2-3. PG 507-DD 501 interconnections for counted burst operation.

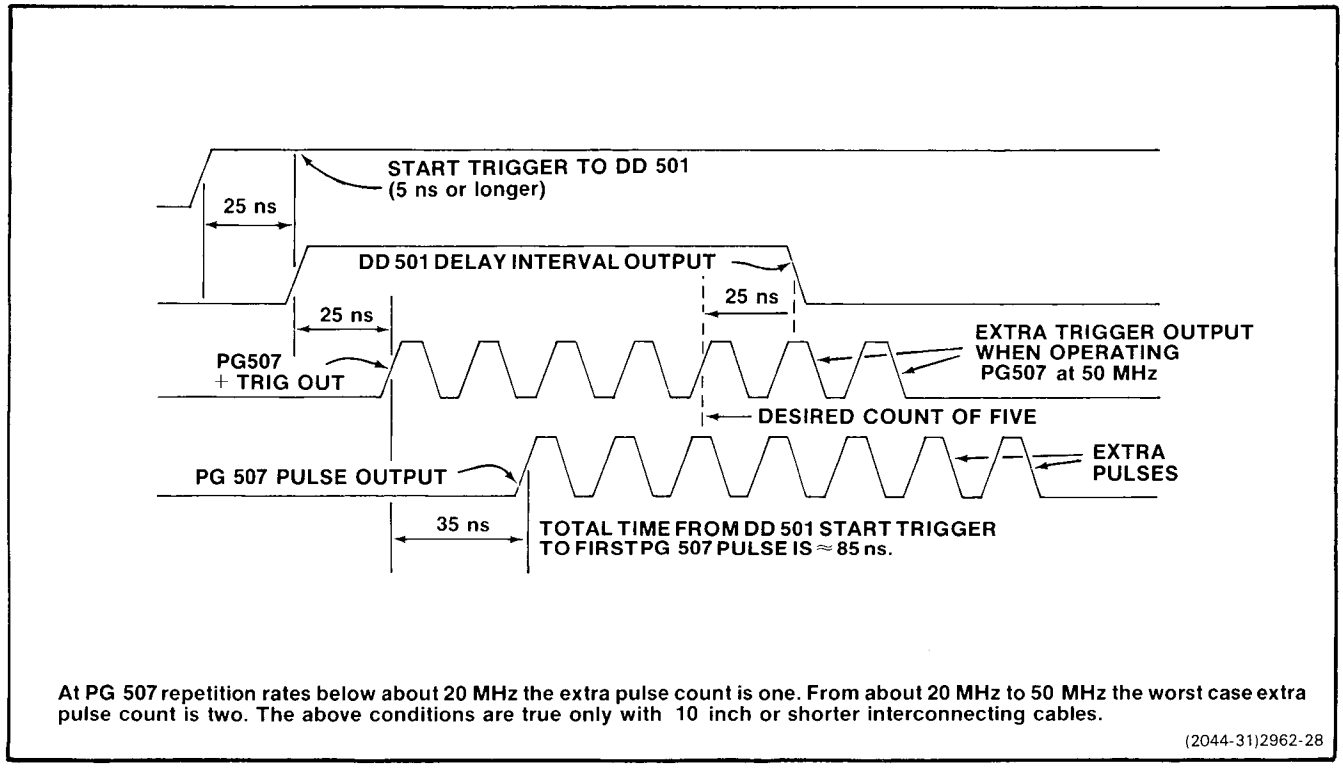

Fig. 2-4. Typical propagation delays using PG 507 with DD 501 in counted burst mode at 50 MHz repetition rate.

PG 507 and the DD 501 controls as described under Intiial Control Settings. Now adjust the PG 507 TRIG/GATE LEVEL or the DD 501 EVENTS LEVEL for the same number of extra pulses at DD 501 EVENTS DELAY COUNT settings of zero and nine.

Definitions of Pulse Characteristics

The following is a glossary of common pulse characteristics used in this manual. They are illustrated in Fig. 2-5.

Amplitude. The maximum absolute peak value of a pulse measured from the baseline regardless of polarity, and excluding unwanted aberrations or overshoot. Measurement points are at 50% of the pulse duration time (pulse high level) and on the baseline (pulse low level) at 50% of the off time (the pulse period minus the pulse duration).

Aberrations. Unwanted deviations or excursions in the pulse shape from an ideal square corner and flat top, i.e., overshoot, undershoot or rounding, ringing, and tilt or slope.

Baseline. The quiescent dc voltage reference level of the pulse waveform.

Complementary Pulse. Normal pulse with high and low levels interchanged. Pulse on-time becomes pulse off-time.

Duty Factor. Sometimes referred to as duty cycle. The ratio of pulse duration to period, or the product of pulse duration and pulse repetition rate. Duty factor in % = Duration/Period X 100.

Falltime. The time interval, at the pulse trailing edge, for the pulse amplitude to fall from the 90% amplitude level to the 10% amplitude level.

Flatness. The absence of long term variations to the pulse top; excluding overshoot, ringing or pulse rounding. Sometimes referred to as tilt or slope.

High Level. The most positive value of a pulse, regardless of unwanted aberrations or overshoot, measured at a point that is located at 50% of the pulse duration.

Low Level. The most negative value of a pulse, regardless of unwanted aberrations or overshoot, measured at a point that is 50% of the off time.

Offset. A dc potential of either polarity applied to the waveform to bias the baseline to an amplitude other than zero.

Overshoot. The short term pulse excursion (or transient) above the pulse top or below the baseline, which is simultaneous to the leading or trailing edge of the pulse.

Period. The time interval for a full pulse cycle, the inverse of frequency or repetition rate, or the interval between corresponding pulse amplitudes of two con-

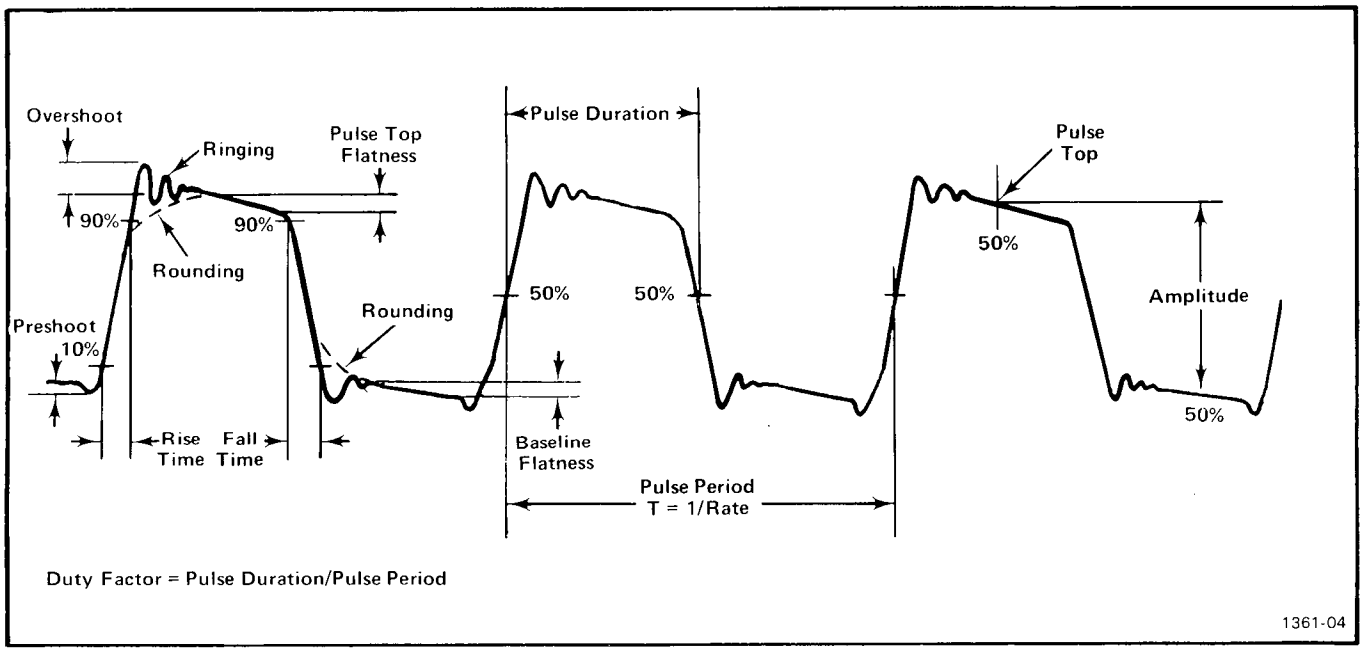

Fig. 2-5. Pulse characteristics.

Scan by Zenith

secutive undelayed or delayed pulses. Generally measured between the 50% amplitude levels of two consecutive pulses.

Preshoot. A transient excursion that precedes the step function. It may be of the same or opposite polarity as the pulse.

Pulse Duration. The time interval between the leading and trailing edge of a pulse at which the instantaneous amplitude reaches 50% of the peak pulse amplitude.

Polarity. The direction from the baseline of the pulse excursion, either positive-going (+) or negative-going (−).

Ringing. Periodic aberrations that dampen in time, following the overshoot.

Risetime. The time interval, at the step function leading edge, for the pulse to rise from the 10% to 90% amplitude levels.

Rounding or Undershoot. The rounding of the pulse corners at the edges of a step function.

Tilt or Slope. A distortion of an otherwise flat-topped pulse, characterized by either a decline or a rise of the pulse top (see Flatness).

Repackaging Information

If the Tektronix instrument is shipped to a Tektronix Service Center for service or repair, attach a tag identifying the owner (with address) and the name of an individual at your firm to contact. Include the instrument type, options, serial number, and a description of the service required.

Save and reuse the package in which your instrument was shipped. If the original packaging is unfit for use or not available, repackage the instrument as follows:

Surround the instrument with polyethylene sheeting to protect the instrument finish. Obtain a carton of corrugated cardboard of the correct carton strength having inside dimensions of no less than six inches more than the instrument dimensions. Cushion the instrument by tightly packing three inches of dunnage or urethane foam between carton and instrument on all sides. Seal the carton with shipping tape or an industrial stapler.

The carton test strength for this instrument is 200 pounds per square inch.

THEORY OF OPERATION

Introduction

Refer to the block diagram and the schematics in the foldout pages at the rear of this manual as well as the following discussion to understand the operation of the PG 507.

Input Circuitry ◇1

This circuitry processes the external trigger or gating signal to provide triggering waveforms for the period circuit. The 50 Ω input impedance for this circuitry is provided by R1030, switched in or out by S1020. When R1030 is out of the circuit, the input impedance is 1 MΩ obtained by R1132 and R1130. Diodes CR1130 and CR1230 are protective diodes. The proper voltage at the drain of Q1224 is set by VR1230. The source voltage for Q1224 is set by VR1130. Impedance transformation, with no voltage shift, is obtained by source follower Q1224. Constant current for Q1224 is supplied by Q1226.

A differential comparator is formed by Q1220 and Q1222. This circuitry compares the trigger or gate input level with the level set by the front panel TRIG/GATE LEVEL control, R500. Constant current for this comparator is provided by Q1120. Level control voltage for the differential comparator is provided by operational amplifier U1330. The output, pin 6, swings over a range of ±3 V. The voltage at TP36 is the triggering level voltage, as set by the TRIG/GATE LEVEL control. If the triggering or gating voltage at the base of Q1220 is more positive than at TP36, Q1222 is conducting and Q1220 is off. This places the collector of Q1222 more positive than the collector of Q1220. When the gating or triggering waveform level drops below the voltage at TP36, Q1220 conducts and Q1222 turns off.

This switching waveform is applied to the bases of Q1210A and B, operating as a differential pair. The collector of Q1210A drives Q1210C in a cascode mode of operation. The collector of Q1210C drives the base of Q1210D which, as an emitter follower, drives the input of U1110B. This gate operates as a dual input Schmitt trigger shaper. When the emitter of Q1210D drops to about 3.8 V, pin 7 of U1110B drops to its low level. The inverting output terminal, pin 6, is always in an opposite state from pin 7. Positive feedback for this portion of the Schmitt is provided by R1114. If the unit is manually triggered, pin 10 of U1110B is momentarily connected to +5 V. Pin 10 of U1110B, along with R1201 and R1200 now acts as a Schmitt shaper for the manual trigger. This action holds the output, pin 7, high and the inverting output, pin 6, low as long as the MAN button is pressed.

When the plus slope is selected for triggering or gating, +5 V is applied to pin 4 of U1110A. This gate is now inhibited and the signal passes through U1110C. The outputs of U1110A and C are connected together and a high on either output overrides the low. Pin 13 of U1110C is low as long as the anodes of CR1401 and CR1400 are low. This occurs when the logic circuitry has enabled the input circuitry. When the control logic is set to disable the input circuitry, the anodes of these diodes are raised to +5 V. This disables gates U1110A and U1110C.

Pin 12 of U1110C now shifts between the high and the low state corresponding with the input gate or trigger. The output from U1110C, pin 14, is passed to the Period Generator circuit. A high at the output of U1110C turns the Period Generator off; a low starts the Period Generator.

TRIG'D/GATED Light Circuitry ◇1

Transistors Q1414, Q1412, Q1410 and their associated components compose the circuitry that operates the front panel TRIG'D/GATED light emitting diode. The pair Q1414 and Q1412 form a modified astable multivibrator, while Q1410 operates as a voltage source. When the output of U1110A or C is high (Period Generator off) or the logic circuitry has inhibited the input circuitry, the base of Q1414 is high. This causes the base of Q1412 to be low through R1415. The collector of Q1412 is now high and the light emitting diode is off. When the base of Q1414 goes low, the base of Q1412 goes high, the collector goes low and the light emitting diode turns on. The light emitting diode circuitry follows the triggering gate up to about a 5 Hz rate, i.e., about 100 ms on and 100 ms off. At faster gating frequencies, C1420 inhibits the changing states of this circuitry to about a 5 Hz rate.

Period Generator, Trig Amp & Generator ◇2

This circuitry generates the internal period timing waveform. Logic device U1120B operates as an astable multivibrator. When either input of U1120B is high, pin 7 is high and pin 6 low. The switch timing capacitances in the Period Generator are connected from pin 7 to pin 11. These timing capacitors are selected by the PERIOD switch, S1200. The period variable (CAL) control, R1004, varies the resistance in the negative feedback loop.

To start the period cycle, assume pin 7 of U1120B goes high and pin 6 low. This positive step, at pin 7, is coupled through the selected period timing capacitor to pin 11. As

Scan by Zenith

the timing capacitor discharges through the resistances connected between pins 11 and 6, the voltage at pin 11 decays. This decay is at a rate determined by the timing capacitor and these resistances. When the switching level (approximately 4 V) is reached, pin 7 goes low and pin 6 goes high. The negative step, at pin 7, is coupled through the timing capacitor and appears at pin 11. The capacitor now charges the resistances until the switching level is reached. The period cycle repeats. The symmetry adjustment, R1114, compensates for the bias current through pin 11.

When the PERIOD switch is in any position other than EXT TRIG OR MAN, switch S1200-2 is open. This lowers pin 10 of U1120B and permits the period generator to operate during the external gate on time. During the time of the external gating signal pins 4 and 2 of U1120A are low and pin 3 is high. As transistors Q1212 and Q1310 form a comparator, with their bases connected to pins 3 and 2 of U1120A respectively, the collector of Q1212 is low. This causes the emitter of Q1210 to be low, as well as pin 11 of U1120B. This allows the Period Generator to operate. During the gated off time this action reverses. Pin 11 of U1120B rises and inhibits the Period Generator.

Potentiometers R1112 and R1002 adjust the lock up voltage at pin 11 of U1120B so that, at turn on, the first period generated is identical in time with subsequent periods. Potentiometer R1002 is switched into the circuit only on the 20 ns range. Components R1214 and C1214 form a time constant to help compensate for first period error.

With the PERIOD switch in the EXT TRIG OR MAN position, S1200-2 is closed. This places a high on pin 10 of U1120B locking pin 7 high and pin 6 low, irrespective of the level on pin 11. This disables the Period Generator. Pin 15 of U1120C now follows pin 4 of U1120A, in phase with the input triggering signal. Pin 14 of U1120C drives Q1120 and pin 15 drives Q1122. The output from the collector of Q1122 is in phase with the trigger or gate input signal. This provides the + TRIG OUT signal. The phase of the waveform at the collector of Q1120 is inverted.

Delay Generator ◇3

This circuitry provides the delay for delayed or paired pulse operation. As the signal from the Period Generator or the external trigger input goes from high to low at pin 7 of U1420B, pin 3 goes high. This causes pin 5 of U1420A to go high and pin 2 low. Pin 13 of U1420D and pin 9 of U1410B go low. Pin 15 of U1420D goes high, but pin 10 of U1410B does not follow until about 10 ns later. This is due to the delaying action of R1424 and C1520. When pin 9 of U1410B goes low, pin 6 goes high, assuming pin 11 is already low. Pin 6 stays high until pin 10 goes high, as described above. This action provides the delay generator with about a 10 ns wide trigger pulse under all input conditions.

The positive-going trigger pulse, at pin 5 of U1410A, causes pin 3 to go low and pin 2 high. Positive feedback through R1512 and C1510 causes pin 4 to go high. The low at the base of Q1616 turns Q1616 off. The emitter of Q1616 goes negative at a rate determined by the selected timing capacitor and current source Q1614, with its variable emitter resistances. As the emitter of Q1616 goes negative, it pulls the base of Q1610 negative which lowers pin 4 of U1410A. When pin 4 reaches the switching threshold ($\approx$4 V) pin 2 goes low and pin 3 high. The timing capacitor discharges through Q1616. The monostable delay generator is now reset for the next trigger pulse. Transistor Q1612 provides a constant load for the power supplies irrespective of the current flowing through Q1610. The delay generator is disabled in the UNDLY mode by grounding the cathode of CR1510 through S1820B.

DELAY and UNDLY Pulse Generator ◇3

The output from the delay generator connects to pin 13 of U1410C. Pin 15 of U1410C is high during the delay time and pin 14 is low. Gates U1630B and U1530D provide a positive-going trigger at pin 15 of U1630D when the delay time ends. Gates U1630A and U1630C provide a positive-going trigger at pin 14 when the delay time starts. As the delay time starts, pin 4 of U1630A goes low as does pin 11 of U1630C. Pin 10 of U1630C is low as the anode of CR1640 is grounded through the UNDLY switch, S1820A. The low at pin 11 of U1630C allows pin 14 to go high. Pin 14 stays high until the propagation time through gate U1630A and the delaying action of R1640 and C1644 allow the high generated in U1630A, from pin 2, to reset U1630C through pin 10. This causes pin 14 to return to its low state. The width of the undelayed output trigger pulse is about 6 ns.

To obtain only the delayed trigger, the anode of CR1640 is connected to +5 V, disabling gate U1630C. The anode of CR1530 is grounded through the DELAY switch. Gates U1630B and U1630D now operate in exactly the same manner as U1630A and C. A positive trigger pulse appears on pin 15 of U1630D when the delay time ends (pin 6 of U1630B goes from high to low).

In the paired pulse mode both gates operate. Gate U1630C provides a positive-going trigger at the start of the delay time and U1630D provides a positive trigger at the end of the delay time.

Duration Generator ◇4

This circuitry generates the pulse duration times. Gate U1540B accepts the delayed or undelayed positive triggers from the delay generator. The result is a positive-going

Scan by Zenith

pulse at pin 5 of U1540A. This triggers the Duration Generator, which operates in the same manner as the Delay Generator. Refer to the discussion under the heading Delay Generator for a description of the Duration Generator operation. Gate U1540C is an output buffer. Pin 12 goes high during the pulse duration time. If pin 13 is low, pin 15 goes high and pin 14 low. Pin 13 controls U1540C in the squarewave and duration modes.

Error Light Control ④

This circuitry illuminates the CONTROL ERROR light when the duration or delay times are greater than the periods of their respective triggers. The positive pulse from the Duration Generator is fed into the D input, pin 10, of U1830A. The clock enable line pin 11 is low. If the duration time is set, so that a trigger pulse (connected to the clock in) for the next duration pulse occurs before the output of the duration generator goes low, the high on the D input, pin 10 of U1830A, is transferred to the output, pin 1. This high is connected to the set input, pin 5, of U1830B which causes the output, pin 2 of U1830B, to go high, illuminating the CONTROL ERROR light, DS500. When the output, pin 2, of U1830B goes high, the inputs to U1830A and B are disabled through the clock enable line. This prevents further trigger inputs until both flip-flops are reset. When the output, pin 2, of U1830B goes and stays high, C1740 starts to charge to the voltage on pin 2, through R1736. This takes approximately 100 ms. When the reset inputs to U1830A and B, pins 13 and 4, reach a high level (about 4 V) U1830A and B are reset and C1740 discharges through R1736. When these reset inputs return to the low level, both flip-flops are ready to accept triggers. The error cycle is now ready to repeat. If the delay time is set for a time greater than the period of the delay triggers, the high on pin 7 of U1830B transfers to pin 2 directly, and the light is illuminated. Reset takes place in the same manner as described above.

The CONTROL ERROR light is also illuminated for certain improper control settings. Fig. 3-1 shows a simplified schematic for the CONTROL ERROR indicator logic and control settings causing illumination.

Output A Amplifier ⑤

The Output A and Output B Amplifier (schematic 8) are basically identical. The positive and negative rise and fall circuits are also similar. Only the positive-going Output A Amplifier circuitry is described in detail.

An ECL signal with period and duration times selected by the operator is present at J1420. This waveform inputs to U1320A and B. The position of S1630, COMPLEMENT NORM, determines the phase relationship of the switching signals at pins 12 and 13 of U1320B to the input at pin 15. This switch shifts the output phase of U1320B 180°. The signal from U1320A drives the Output B Amplifier. The output squarewave is generated in two parts by parallel circuitry. The two parts are the rise and fall edges and the level holding currents. For a positive-going output signal, the base of Q1412 goes positive and Q1313 negative. These transistors form an emitter coupled amplifier. The current switched by these transistors, at their emitters, helps determine the risetime of the output waveform. The higher the current, the faster the risetime for a given amplitude.

A fast negative-going voltage spike is developed by L1400 at the base of Q1410 which drives the base of Q1413. This spike is of short duration and determines the risetime of the output waveform (L1430, Q1422 and Q1424 generate the falltimes). For a positive-going transition at the output, the voltage spike at the base of Q1410 translates to a current spike into the emitter of Q1414.

The level holding current switching signal is a positive-going voltage at the collector of Q1313 as it turns off by a negative-going signal at the base. A constant-voltage source for Q1313 is provided by Q1210. The collector of Q1313 is clamped by CR1310 preventing saturation. The rising voltage at the collector of Q1313 switches the constant current in R1311 away from Q1311 and R1410 to the emitter of Q1310. Because the base of Q1411 has a dc bias, the voltage at the emitter of Q1411 does not change when the current in Q1311 is turned off. However, the current into the emitter of Q1411 increases by the amount that Q1311 removed from R1410.

The level holding current from the collector of Q1411 and the rising edge current from the collector of Q1413 sum into the emitter of common base transistor Q1414. The sum of these two currents drive the output emitter followers Q1510, Q1513, Q1520, and Q1530 for a rising edge. The voltage at the bases of these four transistors will rise until CR1511 forward biases and clamps the output to the high level voltage reference.

Temperature compensation and bias is provided by CR1410, CR1420 and R1420. The +V Ref voltage determines the positive pulse level into an open circuit. This voltage is controlled by the OUTPUT (VOLTS) HIGH LEVEL control. The +8 V/+22 V is also adjusted by the OUTPUT (VOLTS) HIGH LEVEL control. The difference in voltage between the +8 V/+22 V supply and the +V Ref is sufficient to provide an ample operating window for the output amplifier while minimizing power dissipation.

The falling or negative edge circuitry operates in a manner similar to the rising or positive edge circuitry just described with the signal polarities inverted. The common emitter input transistors are Q1320 and Q1420. A voltage spike is generated across L1430. This becomes a current

Scan by Zenith

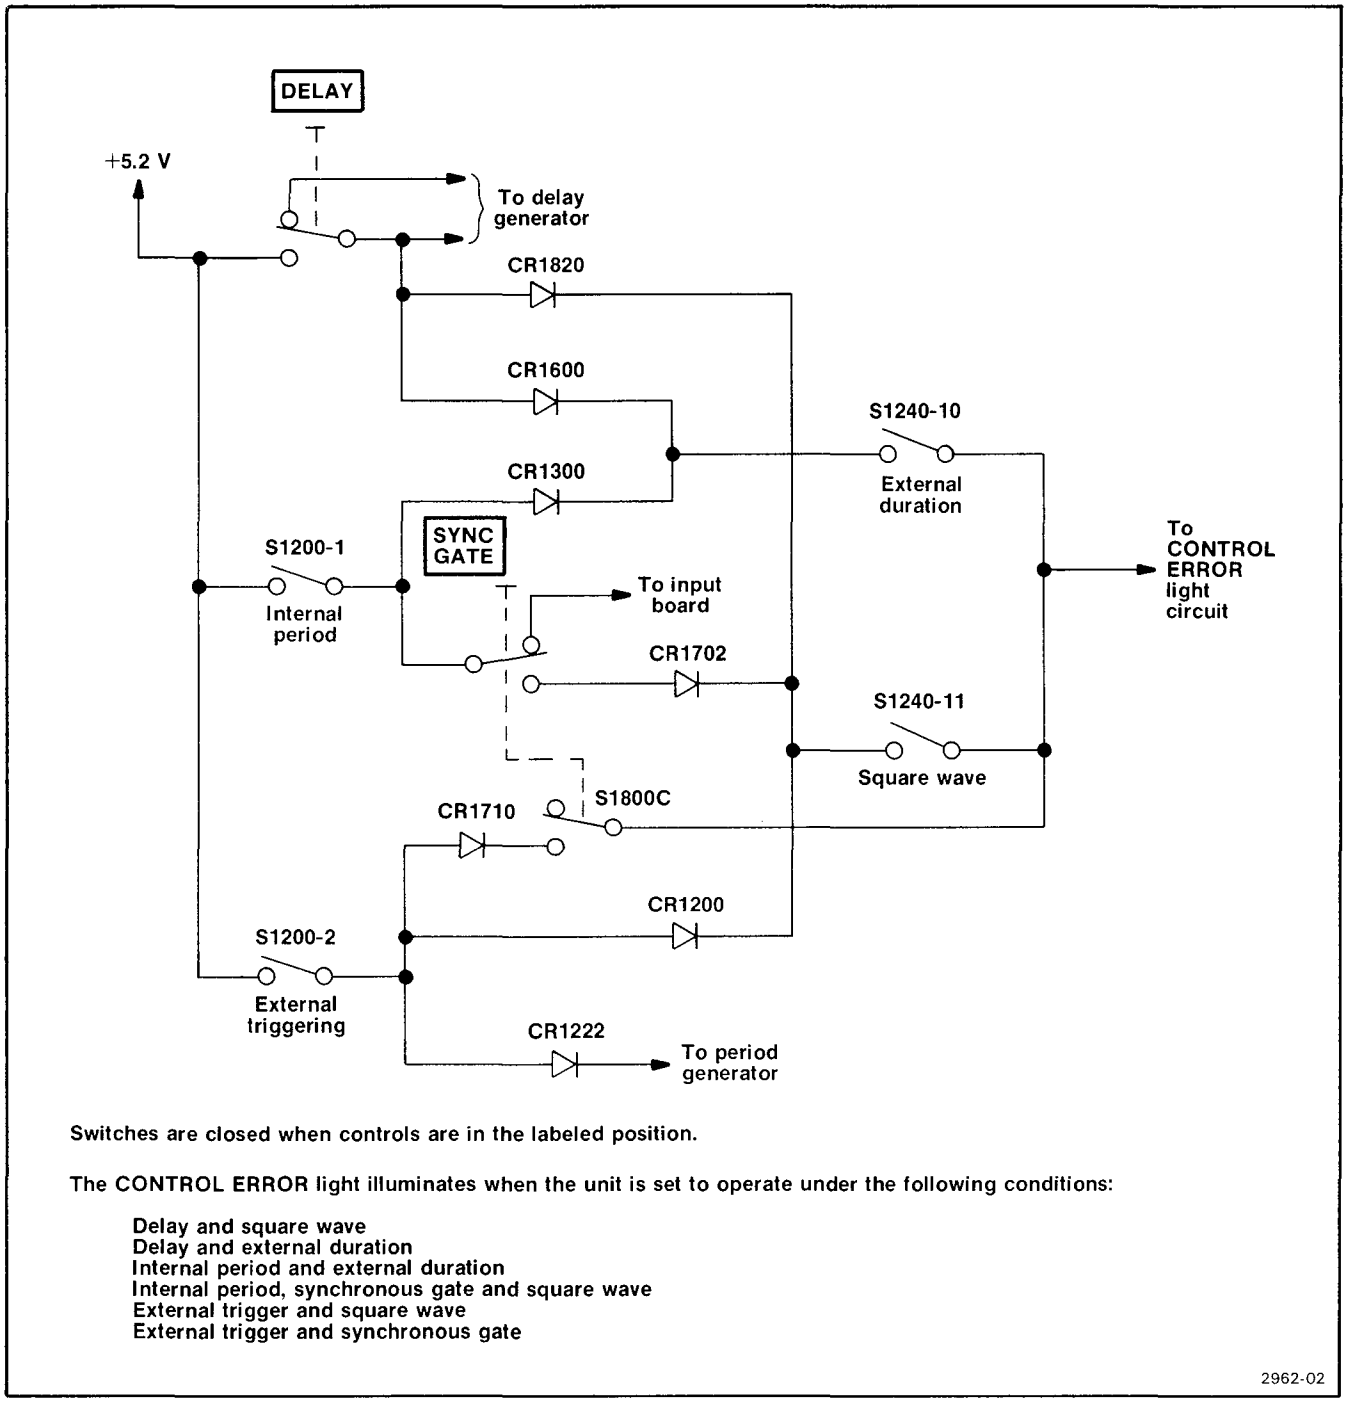

Fig. 3-1. Partial simplified schematic for CONTROL ERROR indicator logic and control settings causing illumination.

spike at the emitter of Q1423 and is mixed with the bias or level holding current from the collector of Q1424. The level holding or bias current change passes from the collector of Q1320 through Q1322, Q1323, and Q1421 to Q1423.

Proper output bias for the level holding current circuitry is provided by R1211 and R1212 in conjunction with Q1202, Q1201 and Q1421. High speed isolation for the base of Q1411 is provided by L1310. Bias for Q1323 is obtained through CR1330 and CR1331.

Scan by Zenith

Level Control Circuitry ⑥

This circuitry produces the output voltage references for the high and low pulse levels. It also supplies the input voltages that program the tracking supplies. Voltage to the plus inputs of U1130A and U1130B are provided from either an external source at rear interface connectors 22A or 22B, the high or low level preset controls R1010 and R1020 or the front panel high and low level controls, R501 and R502. R1013 and R1023 allow calibration for external control voltage inputs. See the Maintenance section of this manual.

The voltage at pins 3 and 5 of U1130A and B vary from ground to +5.2 V. A voltage difference of 2.6 V from pins 3 and 5 produces the maximum 15 V peak-to-peak open circuit output signal. Operational amplifiers U1130A and B are unity gain amplifiers. The output voltages at pins 1 and 7 of U1130 also vary from 0 to +5.2 V from ground. Should the low level voltage exceed the high level voltage, CR1123 turns on to clamp the high level program voltage more positive than the low level program voltage. In this situation the voltage drop across R1128 and CR1122, which is always conducting due to R1123, will exceed the voltage drop across CR1123. That is, the voltage at pin 7 of U1130B is about 0.6 V higher than the voltage at pin 6. This ensures that the high output level is always more positive than the low output level.

The low level program voltage at pin 6 of U1130B is sensed, through R1131 by U1030A pin 3. The output voltage at pin 1 of U1030A is about 2.0 V above the level at pin 6 of U1130B. Biasing is such that CR1031 is always conducting. If the voltage at pin 2 of U1130A exceeds the voltage at pin 6 of U1130B by about 2.6 V (representing a 15 V peak-to-peak output signal) diode CR1030 comes into conduction and clamps the high level program voltage to no more than 2.6 V above the low level program voltage. This action prevents a signal greater than 15 V peak-to-peak from appearing at the output.

The voltages at pin 2 of U1130A and pin 6 of U1130B are sensed by the Dual Tracking Power Supplies shown on schematic 11. The high and low level control voltages also are sensed by U1020A and U1020B, respectively. These operational amplifiers translate the program voltage (from 0 to 5.2 V) into the high and low output pulse levels (≈ ±16 V).

High and Low Level Buffer and Risetime Control A ⑦

The outputs from Q1220 and Q1221 provide the currents necessary for constant risetime versus amplitude. The outputs from Q1511 and Q1532 provide the buffered high and low reference level voltages for the Output A Amplifier.

The high and low level program voltages are applied to CR1110 and CR1120 respectively, and are sensed by the inputs of U1010A and B. A slight amount of current, enough necessary to keep CR1110 conducting during all conditions, is supplied by Q1330. The same function is provided by Q1301 for CR1120. Bias for these transistors is provided through Q1200 for Q1330 and Q1300 for Q1301.

Transistor pair Q1511 and Q1512 provide a low impedance output buffer for the +V Ref voltage. The same function is provided for the −V Ref by Q1532 and Q1531. Diodes CR1110 and CR1120 provide temperature compensation for Q1511 and Q1532 respectively. Q1302 is a current source providing bias current for the high level buffered voltage reference. Q1331 performs a similar function for the low level buffered voltage reference.

Higher peak-to-peak output pulse amplitudes require increased current. This current is supplied to the spiking inductors in the output stages, 5 and 8, to maintain risetime at the outputs. Peak-to-peak pulse amplitude is sensed by U1010A and B through R1110 and R1012. The voltage to ground at pin 7 of U1010B is inversely proportional to the peak-to-peak output pulse amplitude. Operational amplifier U1010A serves as an inverter for programming the rising edge current. For increasing output amplitude the voltage sensed at pin 2 of U1110A through R1100 and R1103 goes negative and pin 1 goes positive, increasing the current available through Q1220. Also the voltage sensed at pin 6 of U1110B goes high through the action of U1010A. This causes pin 7 of U1110B to go low increasing the current available to the Output A amplilfier.

As the amount of current for a constant risetime varies nonlinearily with the peak-to-peak amplitude of the output waveform, the feedback resistance changes for U1110A and B. The networks connected to the bases of Q1110 and Q1111 determine the bias with respect to the pulse amplitudes for these transistors. For example, as pin 7 of U1110B goes more negative, Q1111 turns on. This action places R1115 in parallel with R1114, thus, decreasing the amount of current available through Q1211. Q1110 operates with U1110A in the same manner.

Output B Amplifier ⑧

See the circuit description for the Output A Amplifier. With both the A and B output COMPLEMENT NORM switches in the same position, the B output signal will be the complement of the A output.

High and Low Level Buffer and Risetime Control B ⑨

See circuit description for High and Low Level Buffer and Risetime Control A.

Scan by Zenith

Power Supplies (10)

The +11.5 Vdc from the mainframe provides the raw supply voltage for the series regulated +5.2 Vdc supply. The precision voltage regulator, U1800, with voltage divider R1812, R1800, and R1811, provides the reference input to the noninverting input, pin 5. The output voltage is applied to the inverting input, pin 4, through R1813. Sensing differences in the two input potentials, the regulator amplifier provides base current drive from pin 10 to the mainframe series-pass transistor. Current limiting is provided by R1815. When the current from the supply exceeds approximately 1.1 A, the regulator provides no further base drive current to the series-pass element. This limits the output current.

The +33.5 Vdc from the mainframe supplies the regulated +15 Vdc. The three terminal voltage regulator, U500, performs the entire regulating and current limiting functions.

The −33.5 Vdc from the mainframe is the raw supply for the regulated −15 Vdc. A three terminal voltage regulator, U1830, provides the regulating and current limiting function. However, due to additional load considerations, the raw supply is preregulated to decrease power dissipated by the integrated circuit. A shunt current path to the load is furnished by VR1920 and R1820. The Zener voltage also maintains base drive to the series-pass mainframe transistor. This transistor drops the voltage across U1830 by approximately 3.6 V.

Dual Tracking Supplies (11)

These supplies provide the ±8 V and ±22 V power required by the output amplifiers. The voltage at the base of Q1622 varies from 0 V to +5.2 V, depending on the setting of the HIGH LEVEL control. When the voltage at the base of Q1622 varies from 0 V to +2.6 V, the + supply voltage remains fixed at +8 V. As the voltage at the base of Q1622 increases from +2.6 V to +5.2 V, the positive supply voltage increases from +8 V to +22 V.

Transistor Q1622 and Q1620 form a differential comparator. The voltage at the base of Q1620 is referenced between +5.2 V, ground and the output voltage. As the HIGH LEVEL control is increased above +2.6 V, the collector of Q1622 goes negative. This increases current flow through Q1625 and therefore, the series-pass transistor in the mainframe. This raises the plus tracking voltage to the output amplifiers. Feedback to this differential comparator is provided through R1526. Transistor Q1621 prevents the plus tracking voltage from going lower than about +8 V. The base of Q1621 is set at about 2.6 V. When the base of Q1622 goes more negative than about 2.6 V, Q1621 comes into conduction. This holds the common-emitter circuit one diode drop from the base of Q1621. If the base of Q1622 is lowered further, Q1622 loses control of the circuit and the supply voltage remains at the level determined by Q1621, +8 V.

Current limiters for this circuit are Q1623 and Q1626. A differential comparator is formed by these transistors. If the load on the positive supply exceeds the maximum current allowed for the voltage, the voltage drop across R1636 increases conduction in Q1626. This action increases conduction in Q1620 which in turn, allows the collector of Q1622 to go more positive. This action decreases conduction in Q1625 and in the series-pass transistor, limiting current to a safe value. The current source for Q1623 and Q1626 is Q1624. The current flowing through Q1630 is determined by the output voltage. As the output voltage increases the allowable current available from the supply increases. This occurs through the action of Q1630 and current mirror Q1631. These two transistors change the current limit by varying the current through Q1626 as previously described. Higher current with higher voltage is possible due to the reduced voltage drop across the series-pass transistor in the mainframe. Diode CR1530 conducts if the +V supply should go more negative than the ground.

The negative supply operates in the same manner as the positive supply, only the polarities are reversed. Transistors Q1600 and Q1700 form the basic comparator. The base of Q1600 varies between 0 V and +5.2 V. The negative output voltage is prevented from going more positive than about −8 V by Q1701. The series-pass transistor is driven by Q1702. The comparator transistors for current limiting are Q1610 and Q1710. The current source for the current comparator is Q1711. Voltage sensing for current increase is provided by Q1712; Q1713 is the current mirror. Diode CR1610 prevents the negative output voltage from going more positive than ground.

CALIBRATION

PERFORMANCE CHECK PROCEDURE

Introduction

This procedure checks the electrical performance requirements as listed in the Specification section in this manual. Perform the Adjustment Procedure if the instrument fails to meet these checks. In some cases, recalibration may not correct the discrepancy; circuit troubleshooting is then indicated. Also, use this procedure to determine acceptability of performance in an incoming inspection facility.

Calibration Interval

To ensure instrument accuracy, check the calibration every 1000 hours of operation or at a minimum of every six months if used infrequently.

Services Available

Tektronix, Inc. provides complete instrument repair and adjustment at local field service centers and at the factory service center. Contact your local Tektronix field office or representative for further information.

Test Equipment Required

The following test adjustment (or equivalent) listed in Table 4-1 is suggested to perform the Performance Check and Adjustment Procedure.

WARNING

Dangerous potentials exist at several points throughout this instrument. Caution must be exercised. When the instrument is operated with the covers removed, do not touch exposed connections or components.

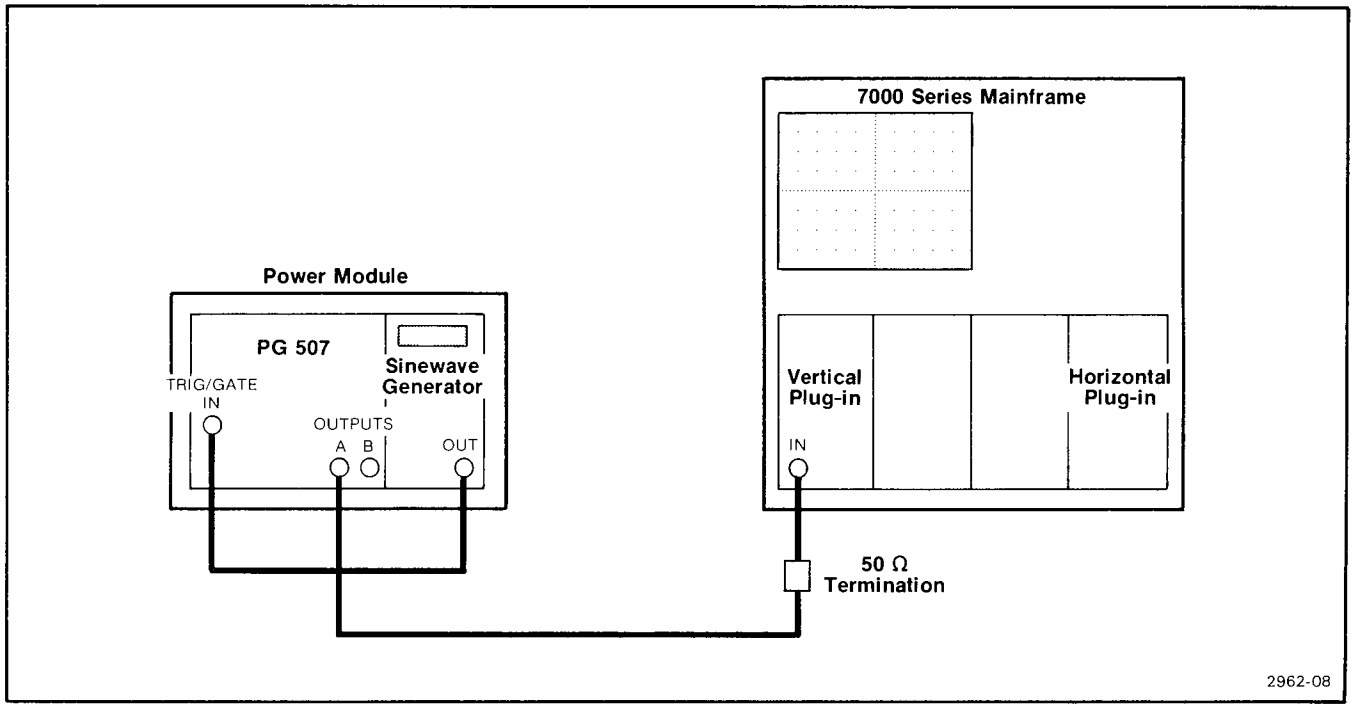

Fig. 4-7. Check setup for trigger level and TRIG/GATE sensitivity.

a. Connect a coaxial cable from the sine-wave generator OUT to the PG 507 TRIG/GATE IN.

b. Connect a coaxial cable from the PG 507 OUTPUT A through a 50 Ω termination to the vertical plug-in INPUT.

c. Change the vertical plug-in AC-GND-DC switch to DC.

d. Rotate the PG 507 TRIG/GATE LEVEL control clockwise until the TRIG'D/GATED light pulses on and off (flashing).

e. CHECK—that the PG 507 CONTROL ERROR light is off and a squarewave signal is displayed on the crt.

f. Rotate the sine-wave generator FREQUENCY VARIABLE control counterclockwise and note the square-wave period (display) tracks with this control.

g. Change the sine-wave generator FREQUENCY RANGE switch to 5-10 and the FREQUENCY VARIABLE control to 10.0.

h. Change the sine-wave generator OUTPUT AMPLITUDE to 0.8.

i. Set the PG 507 TRIG/GATE LEVEL control for a displayed pulse.

j. CHECK—for a stable pulse on the crt display.

k. Set the PG 507 TRIG/GATE LEVEL control to +3 V MAN.

l. CHECK—for no pulse display on crt and that displayed trace is approximately 2.5 graticule divisions above the center graticule line with the TRIG'D/GATED light on.

m. Press and hold the PG 507 MAN pushbutton switch.

n. CHECK—that the displayed trace shifts approximately 2.5 divisions below the graticule center line and the TRIG'D/GATED light is off.

o. Release the PG 507 MAN pushbutton switch and press the SLOPE +/− switch to + (in).

p. CHECK—that the TRIG'D/GATED light is off and the displayed trace is approximately 2.5 graticule divisions below the center graticule line.

Scan by Zenith

10. Check Trigger Level Range (≥±3 V)

Refer to Fig. 4-7 for check setup with the following exception.

PG 507	
SLOPE +/−	− (out)
Input Impedance (internal switch)	1 MΩ

WARNING

The PG 507 input impedance switch to be changed by qualified service personnel only.

a. Change the sine-wave generator FREQUENCY RANGE switch to read between 2.5 to 5 and the AMPLITUDE MULTIPLIER to X1.

b. Set the sine-wave generator OUTPUT AMPLITUDE to 3.0.

c. Rotate the PG 507 TRIG/GATE LEVEL control from clockwise to counterclockwise position.

d. CHECK—that the crt display changes from a lower level flat line through smooth durations to an upper level flat line.

e. Change the PG 507 SLOPE +/− switch to + (in).

f. Rotate the PG 507 TRIG/GATE LEVEL control from clockwise to counterclockwise position.

g. CHECK—that the display now changes from the lower level flat line through smooth durations to an upper level flat line.

h. Set the internal Input Impedance switch back to the 50 Ω position.

11. Check Period, Delay, and Duration Jitter (≤0.1% +50 ps)

Refer to Fig. 4-8 check setup and preliminary control control settings with the following exceptions.

PG 507	
PERIOD	20 ns
CAL	ccw
DELAY	10 ns
CAL	cw
DURATON	10 ns
CAL	ccw

Period Jitter

a. Connect a coaxial cable from the PG 507 OUTPUT A through a 50 Ω termination to the vertical plug-in CH 1 INPUT.

b. Adjust the PG 507 PERIOD CAL control to display 1 cycle of signal for each horizontal graticule division.

c. Set the horizontal plug-in PULL FOR ALT—PUSH FOR DLY'D out and in the .5 ns position.

d. Set the horizontal plug-in INTENSITY control for an intensified displayed waveform.

e. Adjust the horizontal plug-in DELAY TIME MULT control so that the intensified portion of the display is on the second cycle.

f. Set the horizontal plug-in PULL FOR ALT—PUSH FOR DLY'D switch in and set the DELAY TIME MULT control to display the rising edge of the waveform.

g. CHECK—that the period jitter measures less than 0.2 major horizontal graticule division.

h. Adjust the PG 507 PERIOD control to read 20 ms and rotate the PERIOD CAL control fully clockwise.

i. Detach the coaxial cable from the vertical plug-in INPUT and remove the 50 Ω termination. Re-attach cable to the digital counter CH B IN.

j. Rotate the digital counter CH B LEVEL control for a stable display readout. Note and record this readout.

k. Note the first four counter display readout digits (from left to right) and count 10 gate cycles (minimum,).

l. CHECK—the digital counter display for a readout change of less than 0.1% during 10 gate cycles.

Delay Jitter

a. Change the PG 507 PERIOD control to 20 ns and rotate the PERIOD CAL control clockwise.

b. Remove the coaxial cable from the digital counter CH B IN. Re-attach the 50 Ω termination to cable and connect to the vertical plug-in INPUT.

c. Connect a coaxial cable from the PG 507 +TRIG OUT to the horizontal plug-in MAIN TRIG IN.

d. Change the horizontal plug-in MAIN TRIGGERING SOURCE switch to EXT, set the PULL FOR ALT—PUSH FOR DLY'D switch out and in the .5 ns position. Rotate the POSITION control to display the leading edge of the first pulse on the second vertical graticule line.

e. Change the PG 507 MODE switch to DELAY (in) and set the DELAY CAL control to display the leading edge of the first pulse on the third vertical graticule line.

f. Adjust the horizontal plug-in DELAY TIME MULT control to intensify the first pulse.

g. Set the horizontal plug-in PULL FOR ALT—PUSH FOR DLY'D switch in and adjust the DELAY TIME MULT control to display the leading edge of the pulse.

h. CHECK—that the delay jitter measures less than 0.2 major horizontal graticule division.

Scan by Zenith

i. Change the PG 507 PERIOD control to 20 ms, the DELAY control to 10 ms, and rotate the DELAY CAL control clockwise.

j. Detach the coaxial cable from the horizontal plug-in MAIN TRIG IN and re-attach to the digital counter CH A IN.

k. Detach the coaxial cable from the vertical plug-in INPUT, remove the 50 Ω termination and re-attach cable to the digital counter CH B IN.

l. Change the digital counter FUNCTION switch to TIME A-B and set the CH A and CH B LEVEL controls for a stable count readout. Note and record this display readout.

m. Note the first four counter display readout digits (from left to right) and count 10 gate cycles (minimum).

n. CHECK—the digital counter display for a readout change of less than 0.1% during 10 gate cycles.

Duration Jitter

a. Change the PG 507 PERIOD control to 20 ns, and rotate the DELAY CAL control counterclockwise. Push the MODE UNDLY switch in.

b. Remove the coaxial cable from the digital counter CH B IN. Re-attach the 50 Ω termination to cable and connect to the vertical plug-in INPUT.

c. Change the horizontal plug-in MAIN TRIGGERING SOURCE switch to INT and set the PULL FOR ALT—PUSH FOR DLY'D switch out and in the .5 ns position.

d. Set the PG 507 DURATION CAL control to display a positive duration of 1 major horizontal graticule division.

e. Adjust the horizontal plug-in DELAY TIME MULT control to intensify the falling edge of the first pulse.

f. Reset the horizontal plug-in PULL FOR ALT—PUSH FOR DLY'D switch in and adjust the DELAY TIME MULT control to center the falling edge of the displayed pulse on the crt.

g. CHECK—that the duration jitter measures less than 0.2 major horizontal graticule division.

h. Detach the coaxial cable from the vertical plug-in INPUT and remove the 50 Ω termination. Re-attach cable to the digital counter CH B IN.

i. Change the PG 507 PERIOD control to 20 ms, the DURATION control to 10 ms and rotate the DURATION CAL control clockwise.

j. Change the digital counter FUNCTION switch to WIDTH B.

k. Rotate the digital counter CH B LEVEL control for a stable display. Note and record this display readout.

l. Note the first four counter display readout digits (from left to right) and count 10 gate cycles (minimum).

m. CHECK—the digital counter display for a readout change of less than 0.1% during 10 gate cycles.

n. Remove all connections.

This completes the performance check.

Scan by Zenith

ADJUSTMENT PROCEDURE

Introduction

Use this Adjustment Procedure to restore the PG 507 to original performance requirements. This Adjustment Procedure need not be performed unless the instrument fails to meet the Performance Requirements of the Electrical characteristics listed in the Specification section, or if the Performance Check procedure cannot be completed satisfactorily. If the instrument has undergone repairs, the Adjustment Procedure is recommended.

Satisfactory completion of all adjustment steps in this procedure assures that the instrument will meet the Performance Requirements.

Test Equipment Required

The test equipment (or equivalent) listed in Table 4-1 is required for adjustment of the PG 507. Specifications given for the test equipment are the minimum necessary for accurate adjustment. All test equipment is assumed to be correctly calibrated and operating within specifications.

If other test equipment is substituted, the calibration setup may need to be altered to meet the requirements of the equipment used.

Preparation

Access to the internal adjustments is achieved most easily when the PG 507 is connected to the power module with flexible plug-in extenders. Remove the left side cover of the PG 507 to reach the adjustments on the Timing board. Remove the right side cover to reach the adjustments on the Output B board. Remove the top cover for adjustments access on the Output A board. Refer to Adjustment Locations and Adjustment setups in the pull-out pages at the rear of this manual.

NOTE

Make adjustments at an ambient temperature between +20°C and +25°C.

Preliminary Control Settings

1. Check the +15 V Supply Accuracy

a. Insert the PG 507 and digital multimeter into the power module.

b. Connect the power module power cord to the VARIAC and turn on the power module and VARIAC.

c. Connect the test leads to the digital multimeter HI and LO inputs.

d. Connect the digital multimeter HI test lead to the PG 507 +15 V test point (TP1800) located on the Output B board. Connect the LO test lead to the GND test point (TP1640).

e. The digital multimeter readout must indicate between +14.250 and +15.750.

f. Remove the HI test lead.

Scan by Zenith

2. Check the −15 V Supply Accuracy

a. Connect the digital multimeter HI test lead to the −15 V test point (TP1920) located on the Output B board.

b. The digital multimeter readout must indicate between −14.250 and −15.750.

c. Remove the HI test lead.

3. Adjust the +5.2 V ADJ, R1800

a. Connect the digital multimeter HI test lead to the +5 V test point (TP1910) located on the Output B board.

b. ADJUST—potentiometer R1800 located on the Output B board until the digital multimeter readout indicates +5.20.

c. Remove the HI test lead.

4. Check the + Variable Supply Accuracy

a. Connect the digital multimeter HI test lead to the positive lead of capacitor C1530 located on the Output B board.

b. Change the PG 507 OUTPUT (VOLTS) HIGH LEVEL and LOW LEVEL controls counterclockwise.

c. The digital multimeter readout must indicate between +8.00 and +9.00.

d. Change the digital multimeter RANGE/FUNCTION switch to 200 DC volts.

e. Set the PG 507 OUTPUT (VOLTS) HIGH LEVEL and LOW LEVEL controls clockwise.

f. The digital multimeter readout must indicate between +21.0 and +23.0.

g. Remove the HI test lead.

5. Check the − Variable Supply Accuracy

a. Rotate the PG 507 OUTPUT (VOLTS) HIGH LEVEL and LOW LEVEL controls counterclockwise.

b. Connect the digital multimeter HI test lead to the negative lead of capacitor C1511, located on the Output B board.

c. The digital multimeter readout must indicate between −21.0 and −23.0.

d. Set the PG 507 OUTPUT (VOLTS) HIGH LEVEL and LOW LEVEL controls clockwise.

e. Change the digital multimeter RANGE/FUNCTION switch to 20 DC volts.

f. The digital multimeter readout must indicate between −8.00 and −9.00.

g. Remove test leads.

6. Adjust PER, R1003

Refer to Fig. 8-2 adjustment setup in the pull-out pages and preliminary control settings with the following exceptions.

PG 507

TRIGGERING	
+ SLOPE/− SLOPE	- SLOPE (out)

a. Change the PG 507 PERIOD control to 2 μs and rotate the PERIOD CAL control fully clockwise.

b. Center the displayed trace with the vertical plug-in POSITION control and set the DC-GND-AC switch to DC.

c. Connect a coaxial cable from the PG 507 OUTPUT A through a 50 Ω termination to the vertical plug-in INPUT.

d. Set the PG 507 HIGH LEVEL control to display the signal higher level 2.5 major graticule divisions above the center graticule line.

e. Set the PG 507 LOW LEVEL control to display the signal lower level 2.5 major graticule divisions below the center graticule line.

f. Set the horizontal plug-in TRIGGERING LEVEL/SLOPE controls for a stable positive signal display. Set the VARIABLE (CAL IN) switch in the out position.

g. Rotate the horizontal plug-in VARIABLE and POSITION controls until one displayed period with ten divisions of signal period is graticule centered.

h. ADJUST—potentiometer R1114 located on the Timing board for a displayed signal duration of five graticule divisions.

9. Adjust DUR, R1047

Refer to Fig. 8-3 adjustment setup in the pull-out pages.

a. Rotate the PG 507 PERIOD CAL control fully counterclockwise.

b. Change the horizontal plug-in TIME/DIV control to .2 μs and set the TRIGGERING LEVEL/SLOPE controls for a stable positive signal display.

c. Rotate the PG 507 DURATION control to 1 μs and the CAL fully counterclockwise.

d. ADJUST—potentiometer R1047 located on the Timing board for a displayed signal duration of five graticule divisions.

10. Adjust DUR 10 ns, R1140 and 10 ns DUR COMP, C1430

Refer to Fig. 8-3 adjustment setup in the pull-out pages.

a. Change the PG 507 DURATION control to 10 ns with the DURATION CAL control counterclockwise and the PERIOD control to 20 ns with the PERIOD CAL control counterclockwise.

b. Change the horizontal plug-in TIME/DIV switch to .05 μs and the MAGNIFIER switch to X10.

Scan by Zenith

c. Set the horizontal plug-in LEVEL/SLOPE controls for a stable positive signal display.

d. ADJUST—variable capacitor C1430, located on the Timing board, for maximum positive duration of the displayed signal.

e. ADJUST—potentiometer R1140, located on the Timing board until 1.6 to 1.8 graticule divisions of positive signal duration is displayed at the 50% amplitude point.

f. Remove all cables.

11. Adjust 1 PER, R1112

Refer to Fig. 8-4 adjustment setup in the pull-out pages and preliminary control settings with the following exceptions.

a. Connect a coaxial cable from the sinewave generator OUTPUT to the PG 507 TRIG/GATE IN.

b. Connect a coaxial cable from the PG 507 OUTPUT A through a 50 Ω termination to the vertical plug-in INPUT.

c. Set the PG 507 TRIG/GATE LEVEL control for a flashing TRIG'D/GATED light and a stable crt display.

d. Rotate the horizontal plug-in POSITION control to line-up the rising edge of the second signal cycle on the center vertical graticule line.

e. Rotate the PG 507 PERIOD CAL control clockwise until the period of the second cycle is 4 major horizontal graticule divisions.

f. Set the PG 507 TRIG/GATE LEVEL control for 4 complete cycles per triggered signal.

g. ADJUST—potentiometer R1112, located on the Timing board, for equal first and second cycle period lengths.

12. Adjust 20 ns 1 PER, R1002

Refer to Fig. 8-4 adjustment setup in the pull-out pages.

a. Change the horizontal plug-in TIME/DIV switch to .5 μs.

b. Rotate the PG 507 PERIOD control to 20 ns and the PERIOD CAL control counterclockwise.

c. Rotate the PG 507 DURATION control to 10 ns.

d. Set the sine-wave generator FREQ RANGE to .5 to 1.

e. Set the PG 507 TRIG/GATE LEVEL control for a flashing TRIG'D/GATED light and a stable crt display.

f. Set the sine-wave generator FREQUENCY VARIABLE control for a stable synchronized display.

g. Rotate the horizontal plug-in POSITION control to line-up the second cycle rising edge of the displayed signal on the center vertical graticule line.

h. Rotate the PG 507 PERIOD CAL control clockwise until the period of the second cycle is 4 major horizontal graticule divisions.

Scan by Zenith

i. ADJUST—potentiometer R1002 located on the Timing board for equal first and second cycle period lengths.

j. Remove the sine-wave generator cable connections.

13. Adjust DEL, R1700

Refer to Fig. 8-5 adjustment setup in the pull-out pages (using dotted signal line connections) and preliminary control settings with following exceptions.

PERIOD	0.2 μs

a. Connect a coaxial cable with a 10X attenuator from the sampling unit plug-in input connector (S-1 sampling head) to the PG 507 OUTPUT A.

b. Connect a coaxial cable with a 5X attenuator from the sampling sweep unit plug-in TRIG INPUT to the PG 507 + TRIG OUT.

NOTE

Perform steps 14c through 14y if A or B output boards have undergone major circuit repairs; otherwise, perform steps 14l through 14y only.

c. Center potentiometers R1001, R1000, R1101, and R1100 (located on the A Output board).

d. Rotate the sampling unit DC OFFSET control to center the trace on the crt graticule.

e. Set the sampling unit mVOLTS/DIV switch to 100.

f. ADJUST —potentiometers R1001 and R1101 for the best square-waveform presentation on the crt.

g. Change the PG 507 HIGH LEVEL control to 0 and the LOW LEVEL control to 0.

h. Change the sampling unit mVOLTS/DIV switch for the desired waveform resolution.

Scan by Zenith

i. Rotate the sampling unit OFFSET control to center the displayed waveform on the crt graticule.

j. ADJUST—potentiometers R1000 and R1100 for the best square-waveform presentation on the crt.

k. Repeat steps f through j if necessary for best waveform compromise.

Rising Max/Rising Min—R1001, R1000

l. Set the PG 507 HIGH LEVEL control fully clockwise.

m. Adjust the PG 507 LOW LEVEL control counterclockwise until the displayed waveform amplitude just stops changing (maximum signal with maximum offset condition).

n. Change the sampling unit mVOLTS/DIV switch to 100 and set the OFFSET control to center the displayed waveform. Rotate the VARIABLE (out) control to display the waveform within 8 major graticule divisions.

o. ADJUST—potentiometer R1001 for the best rising front corner of the displayed waveform.

p. Rotate the PG 507 LOW LEVEL control fully clockwise and set the sampling unit OFFSET control to center the displayed waveform. Change the mVOLT/DIV switch and rotate the VARIABLE (out) control to display the waveform within 8 major graticule divisions.

q. ADJUST—potentiometer R1000 for the best rising front corner of the displayed waveform.

r. Repeat steps 14m through 14q for the best waveform compromise throughout the (HIGH LEVEL) amplitude range within the risetime and aberrations specifications.

Falling Max/Falling Min—R1101, R1100

s. rotate the PG 507 LOW LEVEL control fully counterclockwise. Rotate the HIGH LEVEL control to 0.

t. Set the sampling unit OFFSET control to center the displayed waveform and the mVOLTS/DIV switch and VARIABLE (out) control to display the waveform within 8 major graticule divisions.

u. Rotate the HIGH LEVEL control clockwise until the displayed waveform amplitude just stops changing (maximum signal with maximum offset condition).

v. ADJUST—potentiometer R1101 for the best falling front corner of the displayed waveform.

w. Rotate the HIGH LEVEL control fully counterclockwise. Set the sampling unit OFFSET control to center the displayed waveform. Set the mVOLTS/DIV switch and VARIABLE (out) control to display the waveform within 8 major graticule divisions.

x. ADJUST—potentiometer R1100 for the best falling front corner of the displayed waveform.

y. Repeat steps 14s through 14x for the best waveform compromise throughout the (LOW LEVEL) amplitude range within the falltime and aberrations specifications.

15. Adjust OUTPUT B: (following internal controls located on the B Output board)
Rising Max ΔV, R1514
Rising Min ΔV, R1513
Falling Max ΔV, R1404
Falling Min ΔV, R1405

Refer to Fig. 8-7 adjustment setup and Fig. 8-9 pulse characteristics in the pull-out pages.

a. Disconnect the PG 507 OUTPUT A cable connection and connect to the OUTPUT B. Repeat all items in step 14 of this procedure.

REAR INTERFACE ADJUSTS

16. Adjust EXT HIGH LEVEL, R1013 and EXT LOW LEVEL, R1023

NOTE

These adjustments are covered in the Maintenance section of this manual.

This completes the Adjustment Procedure.

Scan by Zenith

MAINTENANCE

INTERNAL MODIFICATIONS

This section of the manual describes internal cables and switch settings and provides general maintenance information. Several internal changes are available to modify the PG 507's capabilities. Each item is described below.

Custom Range Selection

The custom range positions on the PERIOD, DURATION and DELAY controls permit selection of period, duration, and delay times. Selection for each is made by installing a capacitor on the Timing board (Assy A12).

To determine the approximate capacitor value for the desired period, multiply the period time in seconds by 5×10^{-3}. For example, a 50 ms period times 5×10^{-3} equals 250×10^{-6} or 250 μF. This capacitor must be non-polarized and have at least a 6 V rating. Solder this capacitor in the position labeled Period in Fig. 5-1.

To determine the capacitor value for the duration or delay time desired, multiply the time in seconds by 1×10^{-2}. For example, a 50 ms duration or delay time requires 50 ms times 1×10^{-2}, or a 500 μF capacitor. If a polarized capacitor is used, observe the correct polarity. Use at least a 6 V rated capacitor. For a custom duration time, solder this capacitor in the position labeled Duration in Fig. 5-1. For a custom DELAY time, remove the Input board (Assy A11) to gain access to the pads marked Delay in Fig. 5-1.

Input Impedance Selection

To change the TRIG/GATE IN input impedance, remove the plug-in from the power module. Remove the left side

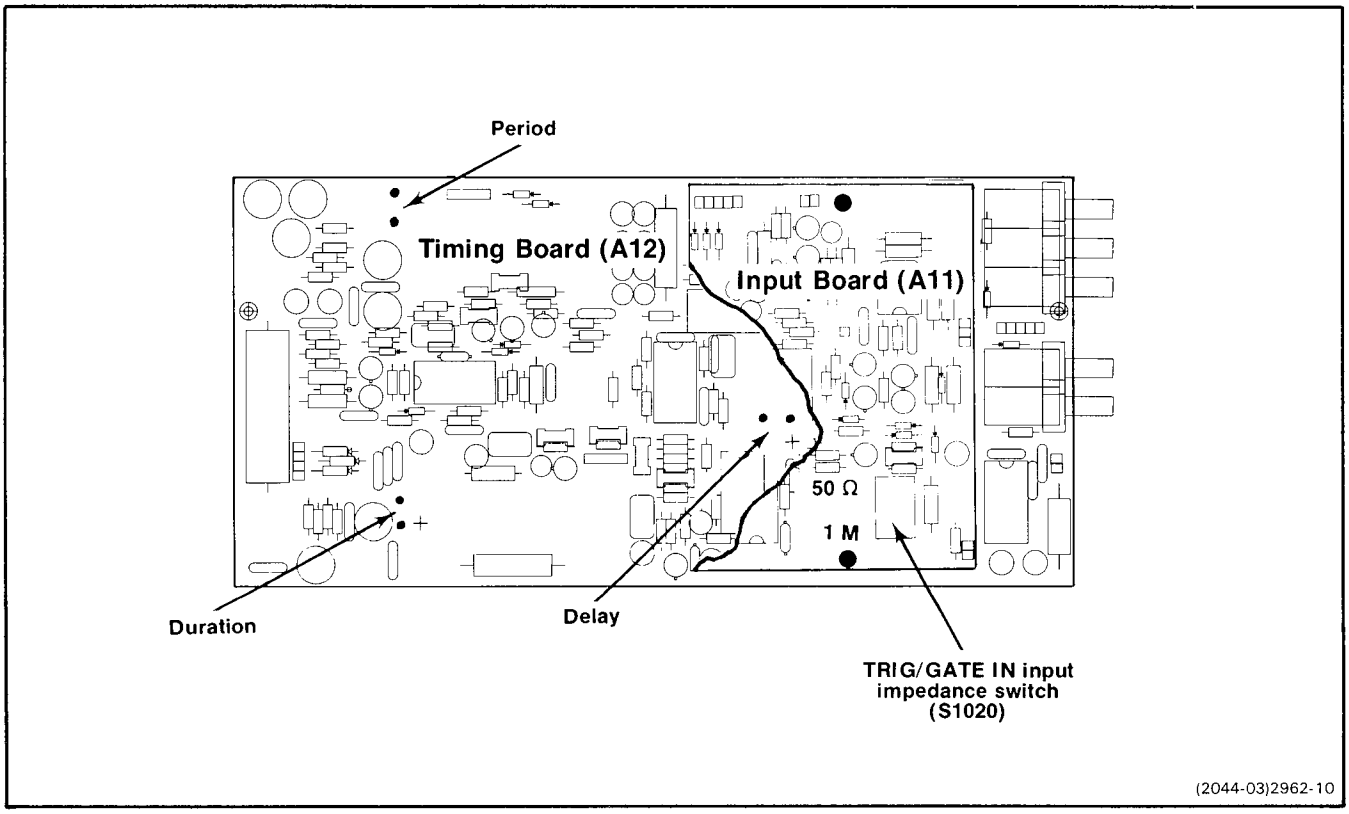

Fig. 5-1. Locations of period, delay, and duration custom timing capacitors and TRIG/GATE IN input impedance switch.

Scan by Zenith

cover. Set the slide switch (R1020), located on the Input board (Assy A11), to either the 50 Ω or 1 MΩ position. See Fig. 5-1.

Trigger/Gate Input

These assignments provide rear interface input for a trigger/gate signal in place of front panel input. The signal lead (24B) must be user installed, but the ground (25B) is factory wired. To make the proper connections, remove the cable extending from the TRIG/GATE IN connector to the Input board (A11) by pulling the cable end from the socket. Install a twelve-inch cable with the proper connectors (Tektronix Part Number 175-1827-00), from the connector on the Input board (A11) labeled Trig/Gate In to the connector labeled Trig In on the Output B board (A14). Refer to Fig. 5-2.

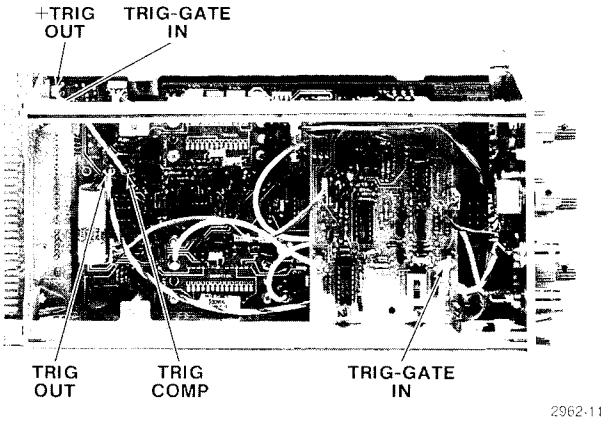

Fig. 5-2. Trigger cable connections.

Trigger Output

The signal lead (27B) and ground connection (28B) are factory wired. The signal available at pin 27B is the complement of the front panel + TRIG OUT. To route the front panel + TRIG OUT signal to the rear interface connector and the rear complement signal to the front panel + TRIG OUT connector, interchange the cable connections to the Trig Out and Trig Comp (TC) coaxial connectors on the Timing board (A12). Refer to Fig. 5-2.

External Control Voltage Adjustment

The output pulse high and low levels can be controlled externally through pins 22B and A at the rear interface connector. Refer to Fig. 5-3 before making these adjustments.

NOTE

Rear interface connector pin assignments are located in the pullout pages in the back of this manual.

To make the internal adjustments for this feature, follow these steps:

High Level Control Voltage Adjustment

1. Set the front panel controls as follows:

PRESET-VAR	in
PERIOD	EXT TRIG or MAN
DURATION	EXT DUR
COMPLEMENT-NORM	both out

2. Using an insulated screwdriver, center the internal Ext Hi (R1013) and the front panel preset HIGH LEVEL controls.

3. Supply a voltage equal to the lowest external input control voltage desired (−15 to +15 V) to pin 22B.

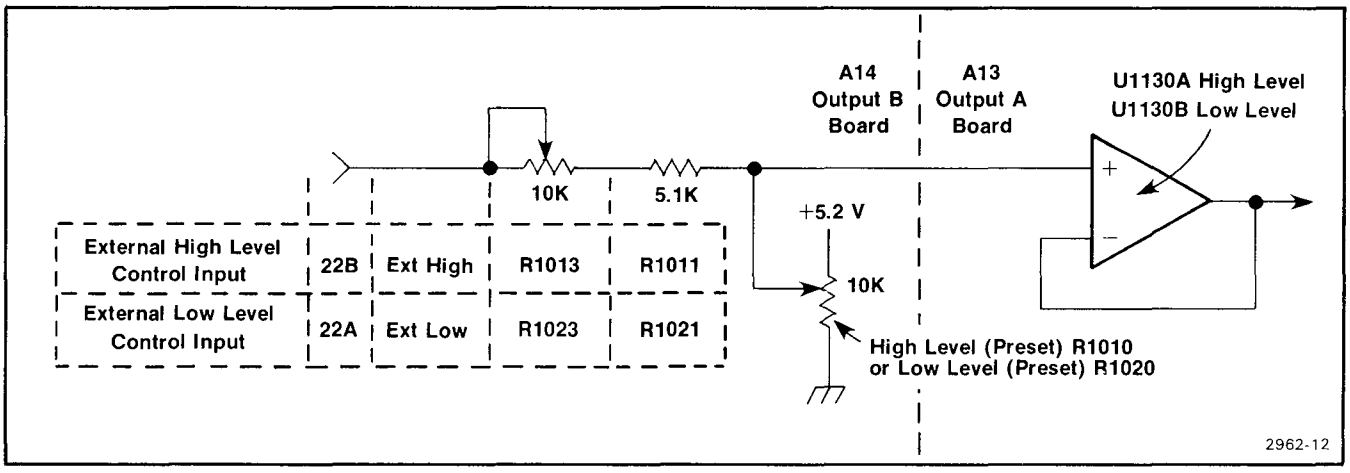

Fig. 5-3. Equivalent circuit of external input for output voltage control.

Scan by Zenith

4. Adjust the front panel preset HIGH LEVEL control for an output voltage equal to the minimum desired output voltage. It may be necessary to adjust the front panel preset LOW LEVEL control since the high level output voltage is clamped by the low level output voltage.

5. Now supply a voltage to equal the highest external control voltage.

6. Adjust the Ext Hi (R1013) for the maximum desired output voltage. It may be necessary to adjust the front panel preset LOW LEVEL control to obtain the desired output. The Ext Hi and the preset HIGH LEVEL controls interact. It may be necessary to repeat steps 3, 4, 5, and 6 until the desired results are obtained.

Low Level Control Voltage Adjustment

7. Push the COMPLEMENT-NORM switch.

8. Center the Ext Lo (R1023) and the front panel preset LOW LEVEL controls.

9. Supply a voltage at pin 22A of the rear interface equal to the lowest control voltage desired (−15 to +15 V).

10. Adjust the preset LOW LEVEL control for an output voltage equal to the lowest output voltage desired.

11. Now supply a voltage equal to the highest desired external voltage.

12. Adjust the Ext Lo potentiometer (R1023) for the highest output voltage desired. As the Ext Lo and preset LOW LEVEL controls interact, readjustment may be necessary. Do not readjust the preset HIGH LEVEL or Ext Hi potentiometers. When adjustments are complete, the output voltages vary linearly and independently with the external control voltages.

Setting the DD 501 Digital Delay Unit For Counted Burst Operation

Refer to the DD 501 Digital Delay instruction manual for information related to setting the DD 501 internal trigger jumpers.

GENERAL MAINTENANCE INFORMATION

Troubleshooting Aids

Diagrams. Complete circuit diagrams are located in the foldout pages in the Diagrams and Illustrations section. The portions of the circuit mounted on circuit boards are enclosed by a solid line. The circuit number of each component in this instrument is shown on a diagram. See the first page of the Diagrams and Illustrations section for definitions of the symbols and reference designators used on the diagrams. Waveforms and voltages are provided with the diagrams for selected circuit locations. A pictorial cabling diagram is also located in the Diagrams and Illustrations section.

Circuit Board Illustrations. Circuit board illustrations are provided in conjunction with the circuit diagrams. Each component shown on a diagram is also identified on the circuit board illustration by its circuit number. A table is provided with each diagram listing components by assembly and circuit number. The table also lists the component grid locations on both the diagram and circuit board illustrations.

Adjustment Locations Illustrations. To aid in locating test points and adjustable components, the adjustment locations pullout page (normally used with the Adjustment procedure) permits rapid location of test points and adjustments.

PG 507 Service Kit. An optional service kit (067-1038-00) is available from Tektronix, Inc. The kit contains the cable assemblies necessry to lengthen connections between the Output A (A13) and Output B (A14) board set and the rest of the instrument. It allows these boards to be removed and then electrically connected to the instrument for easy access to troubleshooting points. Contact your nearest Tektronix representative for ordering information.

Troubleshooting Equipment

Before using any test equipment to make measurements on static sensitive components or assemblies, be certain that any voltage or current supplied by the test equipment does not exceed the limits of the component to be tested.

Scan by Zenith

Static-Sensitive Components

CAUTION

Static discharge can damage any semiconductor component in this instrument.

This instrument contains electrical components that are susceptible to damage from static discharge. See Table 5-1 for relative susceptibility of various classes of semiconductors. Static voltages of 1 kV to 30 kV are common in unprotected environments.

Observe the following precautions to avoid damage:

1. Minimize handling of static sensitive components.

2. Transport and store static-sensitive components or assemblies in their original containers, on a metal rail, or on conductive foam. Label any package that contains static-sensitive assemblies or components.

3. Discharge the static voltage from your body by wearing a wrist strap while handling these components. Servicing static-sensitive assemblies or components should be performed only at a static-free work station by qualified service personnel.

4. Nothing capable of generating or holding a static charge should be allowed on the work station surface.

5. Keep the component leads shorted together whenever possible.

6. Pick up components by the body, never by the leads.

7. Do not slide the components over any surface.

8. Avoid handling components in areas that have a floor or work surface covering capable of generating a static charge.

9. Use a soldering iron that is connected to earth ground.

10. Use only special antistatic suction type or wick type desoldering tools.

Table 5-1

RELATIVE SUSCEPTIBILITY TO STATIC DISCHARGE DAMAGE

Semiconductor Classes	Relative Susceptibility Levels[a]
MOS or CMOS microcircuits or discretes, or linear microcircuits with MOS inputs (Most Sensitive)	1
ECL	2
Schottky signal diodes	3
Schottky TTL	4
High-frequency bipolar transistors	5
JFETs	6
Linear microcircuits	7
Low-power Schottky TTL	8
TTL (Least Sensitive)	9

[a] **Voltage equivalent for levels:**
1 = 100 to 500 V 4 = 500 V 7 = 400 to 1000 V (est.)
2 = 200 to 500 V 5 = 400 to 600 V 8 = 900 V
3 = 250 V 6 = 600 to 800 V 9 = 1200 V

(Voltage discharged from a 100 pF capacitor through a resistance of 100 Ω.)

Circuit Board Removal

For access to the boards, pry off the instrument side covers. Next, remove the four screws attaching the top and bottom covers and remove covers.

Also remove the four Phillips screws and two bullet screws attaching the instrument back plate. See Fig. 5-4.

Output A and B Board Removal. Disconnect all cables connecting the Output A and B boards to the rest of the instrument. Remove the four screws holding the Output B board to the side rails. Carefully slide the Output A and B boards back and out of the chassis.

Scan by Zenith

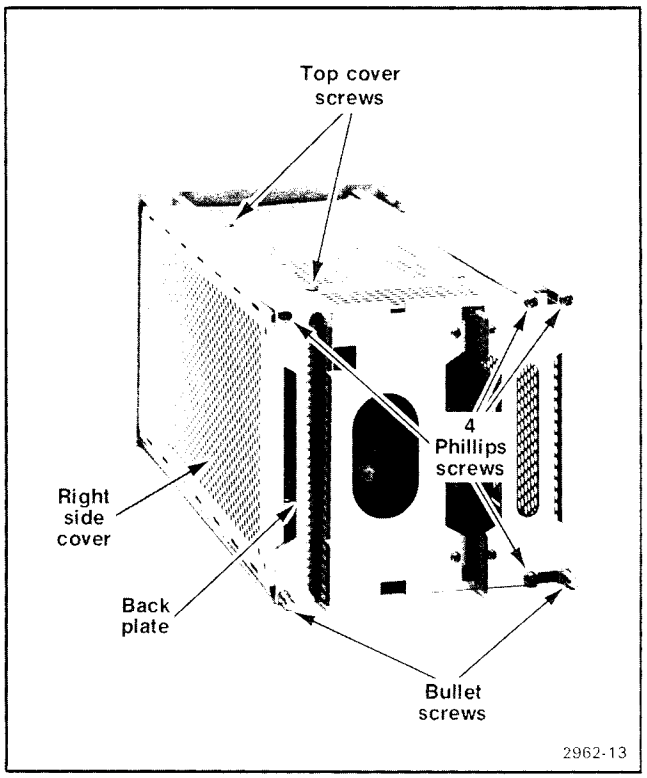

Fig. 5-4. Back plate and cover removal.

To disassemble the Output A and B boards, disconnect the four interconnecting cables. Remove the four screws connecting the two boards via spacers. Carefully pull the boards apart to disengage the three interconnecting square pins.

Input and Timing Board Removal. Remove all cables to the Input and Timing boards. Next remove the PERIOD, DELAY, and DURATION knobs. Loosen the nuts holding the spring clips against the control shafts on the back of the front panel. Remove the four screws attaching the boards to the side rails via spacers. Carefully slide the boards back and out of the chassis.

Reverse the above procedures to reassemble the instrument. When connecting the cables, carefully match the connector index pins.

Front Panel Latch Removal

To disassemble the latch, pry up on the pull tab bar attached to the latch assembly. The latch components can now be removed from the instrument.

Cleaning

This instrument should be cleaned as often as operating conditions require. Loose dust accumulated on the outside of the instrument can be removed with a soft cloth or small brush. Remove dirt that remains with a soft cloth dampened in a mild detergent and water solution. Do not use abrasive cleaners.

CAUTION

To clean the front panel use freon, isopropyl alocohol, or denatured ethyl alcohol. Do not use petroleum based cleansing agents. Before using any other type of cleaner, consult your Tektronix Service Center or representative.

To clean the interior, blow off accumulated dust with dry, low-velocity air (approximately 5 lb/in^2). If further board cleaning is required, use a soft brush or lint-free cloth and one of the following cleaning solutions:

1. A 20:1 solution of distilled water and Kelite Spray White[1]. Flush cleaned area well with clean isopropyl alcohol.

2. A phosphate-free, pH normal detergent and water solution. Flush cleaned area well with distilled water, then with clean isopropyl alcohol.

3. Isopropyl alcohol. Flush the area with clean isopropyl alcohol.

CAUTION

Do not use petroleum based cleansing agents or cleaning solutions that leave a residue on the circuit boards. Before using any other type of cleaner, consult your Tektronix Service Center or representative.

Do not scrape or use an eraser to clean the edge connector contacts. Abrasive cleaning can remove the gold plating.

CAUTION

To prevent damage, circuit boards and components must be dry before applying power.

Drying can be accomplished by placing boards in an oven at 40°C to 60°C for approximately four hours.

Obtaining Replacement Parts

Electrical and mechanical parts can be obtained through your local Tektronix Field Office or representative. However, it may be possible to obtain many of the standard electronic components from a local commercial source. Before purchasing or ordering a part from a source other than Tektronix, Inc., check the Replaceable Electrical Parts list for the proper value, rating, tolerance, and description.

NOTE

When selecting replacement parts, remember that the physical size and shape of the component may affect its performance in the instrument.

Some parts are manufactured or selected by Tektronix, Inc., to satisfy particular requirements or are manufactured for Tektronix, Inc., to our specifications. Most of the mechanical parts used in this instrument have been manufactured by Tektronix, Inc. To determine the manufacturer, refer to the Replaceable Parts list and the Cross Reference index, Mfr. Code Number to Manufacturer.

When ordering replacement parts from Tektronix, Inc., include the following information:

1. Instrument type (include modification or option number).
2. Instrument serial number.
3. A description of the part (if electrical, include complete circuit number).
4. Tektronix part number.

Soldering Techniques

WARNING

To avoid electric-shock hazard, disconnect the instrument from the power source before soldering.

The reliablility and accuracy of this instrument can be maintained only if proper soldering techniques are used when repairing or replacing parts. General soldering techniques which apply to maintenance of any precision electronic equipment should be used when working on this instrument. Use only 60/40 rosin-core, electronic grade solder. The choice of soldering iron is determined by the repair to be made.

CAUTION

The PG 507 Output A and B boards (A13, A14) are multilayer type boards with a conductive path laminated between the top and bottom board layers. All soldering on these boards should be done with extreme care to prevent breaking the connections to this conductive path.

Do not allow solder or solder flux to flow under printed circuit board switches. The printed circuit board is part of the switch contacts; intermittent switch operation can occur if the contacts are contaminated.

When soldering on circuit boards or small wiring, use only a 15 watt, pencil type soldering iron. A higher wattage soldering iron can cause the etched circuit wiring to separate from the board base material and melt the insulation from small wiring. Always keep the soldering iron tip properly tinned to ensure the best head transfer to the solder joint. Apply only enough heat to remove the component or to make a good solder joint. To protect heat sensitive components, hold the component lead with a pair of long-nose pliers between the component body and the solder joint. Use a solder removing wick to remove excess solder from connections or to clean circuit board pads.

Semiconductors

To remove in-line integrated circuits use an extracting tool. This tool is available from Tektronix, Inc.; order Tektronix Part Number 003-0619-00. If an extracting tool is not available, use care to avoid damaging the pins. Pull slowly and evenly on both ends of the integrated circuit. Try to avoid disengaging one end before the other end.

Connector Replacement Procedures

Several methods of interconnection are used in the PG 507. These include coaxial end-lead connector assemblies, multipin connector to circuit board pins, and square pins. The following information provides replacement procedures for each method.

Multipin Connectors. The pin connectors used to connect the wires to the interconnecting pins are clamped to the end of the wires. Refer to Fig. 5-5. To replace damaged multipin connectors, remove the damaged pin from the holder. To do this, insert a scribe between the connector and the holder and pry the connector from the holder. Clamp the replacement pin to the wire. Reinstall the connector in the holder.

If the individual end lead pin connectors are removed from the plastic holder, note the order of the individual wires for correct replacement in the holder.

Scan by Zenith

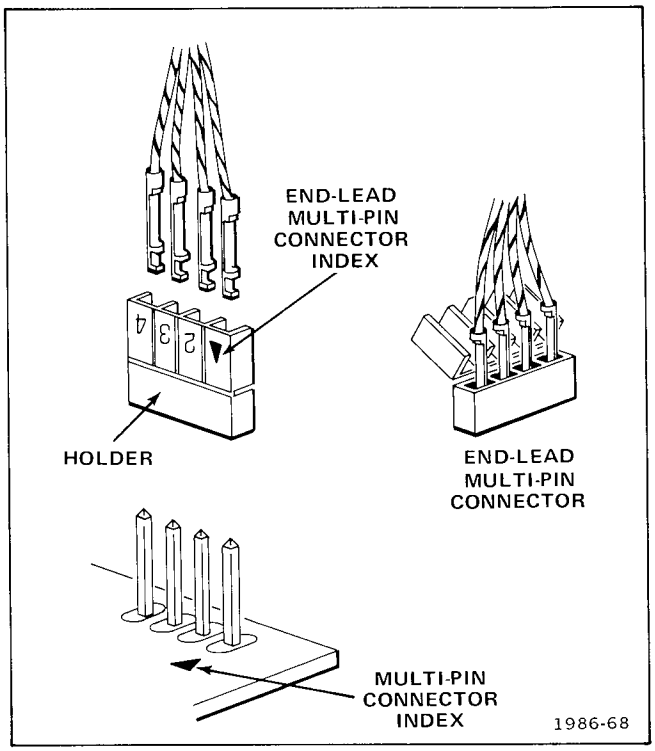

Fig. 5-5. Orientation and disassembly of multipin connectors.

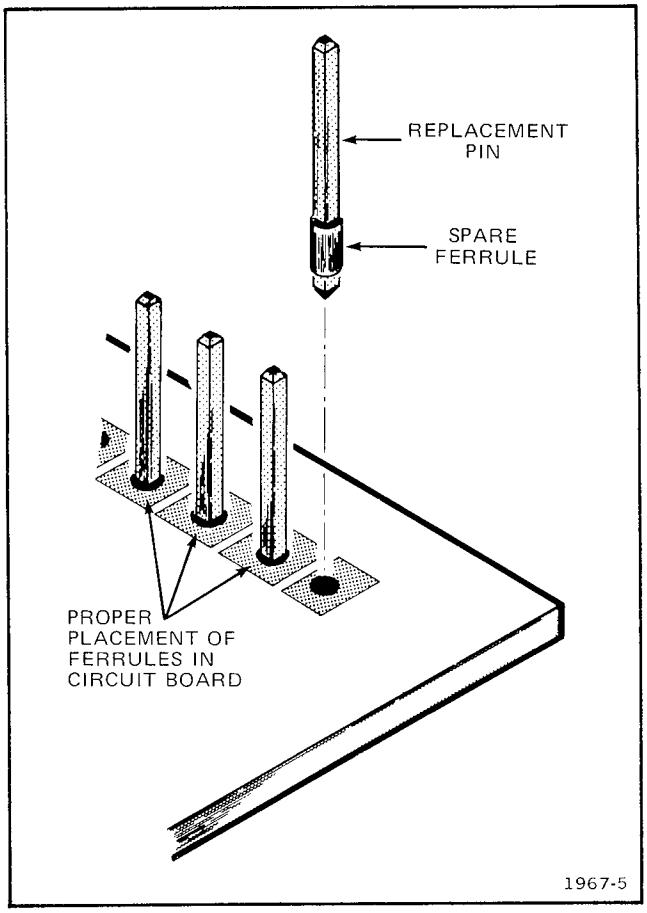

Fig. 5-6. Exploded view of circuit board pin and ferrule.

Circuit Board Pins. A circuit board pin replacement kit (including necessary tools, instructions, and replacement pins with attached ferrules) is available from Tektronix, Inc.; order Tektronix Part Number 040-0542-00. Replacing circuit board pins on multilayer boards is not recommended. (The multilayer boards in this instrument are listed under Soldering Techniques in this section.)

To replace a damaged pin, first disconnect any pin connectors. Then unsolder the damaged pin and pull it from the board with pliers, leaving the ferrule in the circuit board, if possible. See Fig. 5-6. If the ferrule remains in the circuit board, remove the spare ferrule from the replacement pin and press the new pin into the circuit board hole. If the ferrule is removed with the damaged pin, clean out the hole using a solder removing wick and a scribe. Then press the replacement pin, with attached spare ferrule, into the circuit board.

Coaxial End-Lead Connectors. Replacement of coaxial end-lead connectors requires special tools. Repair is best made by replacing the cable as a unit. Refer to the replaceable parts list in the back of the manual for part numbers. Fig. 5-7 shows an exploded view of a coaxial end-lead connector assembly.

Square Pins. The three square pins which connect the Output A and B boards and their sockets are replaced by unsoldering and removing the defective item. Position the replacement part in the board and resolder.

REPLACEABLE ELECTRICAL PARTS

PARTS ORDERING INFORMATION

Replacement parts are available from or through your local Tektronix, Inc. Field Office or representative.

Changes to Tektronix instruments are sometimes made to accommodate improved components as they become available, and to give you the benefit of the latest circuit improvements developed in our engineering department. It is therefore important, when ordering parts, to include the following information in your order: Part number, instrument type or number, serial number, and modification number if applicable.

If a part you have ordered has been replaced with a new or improved part, your local Tektronix, Inc. Field Office or representative will contact you concerning any change in part number.

Change information, if any, is located at the rear of this manual.

LIST OF ASSEMBLIES

A list of assemblies can be found at the beginning of the Electrical Parts List. The assemblies are listed in numerical order. When the complete component number of a part is known, this list will identify the assembly in which the part is located.

CROSS INDEX-MFR. CODE NUMBER TO MANUFACTURER

The Mfr. Code Number to Manufacturer index for the Electrical Parts List is located immediately after this page. The Cross Index provides codes, names and addresses of manufacturers of components listed in the Electrical Parts List.

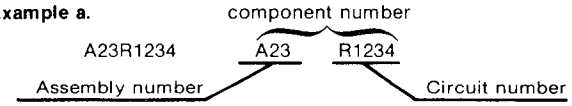
ABBREVIATIONS

Abbreviations conform to American National Standard Y1.1.

COMPONENT NUMBER (column one of the Electrical Parts List)

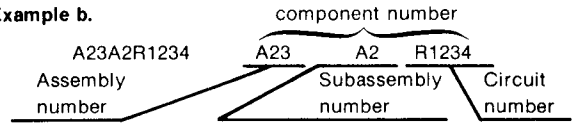
A numbering method has been used to identify assemblies, subassemblies and parts. Examples of this numbering method and typical expansions are illustrated by the following:

Example a.



Read: Resistor 1234 of Assembly 23

Example b.



Read: Resistor 1234 of Subassembly 2 of Assembly 23

Only the circuit number will appear on the diagrams and circuit board illustrations. Each diagram and circuit board illustration is clearly marked with the assembly number. Assembly numbers are also marked on the mechanical exploded views located in the Mechanical Parts List. The component number is obtained by adding the assembly number prefix to the circuit number.

The Electrical Parts List is divided and arranged by assemblies in numerical sequence (e.g., assembly A1 with its subassemblies and parts, precedes assembly A2 with its subassemblies and parts).

Chassis-mounted parts have no assembly number prefix and are located at the end of the Electrical Parts List.

TEKTRONIX PART NO. (column two of the Electrical Parts List)

Indicates part number to be used when ordering replacement part from Tektronix.

SERIAL/MODEL NO. (columns three and four of the Electrical Parts List)

Column three (3) indicates the serial number at which the part was first used. Column four (4) indicates the serial number at which the part was removed. No serial number entered indicates part is good for all serial numbers.

NAME & DESCRIPTION (column five of the Electrical Parts List)

In the Parts List, an Item Name is separated from the description by a colon (:). Because of space limitations, an Item Name may sometimes appear as incomplete. For further Item Name identification, the U.S. Federal Cataloging Handbook H6-1 can be utilized where possible.

MFR. CODE (column six of the Electrical Parts List)

Indicates the code number of the actual manufacturer of the part. (Code to name and address cross reference can be found immediately after this page.)

MFR. PART NUMBER (column seven of the Electrical Parts List)

Indicates actual manufacturers part number.

Scan by Zenith

DIAGRAMS AND CIRCUIT BOARD ILLUSTRATIONS

Symbols

Graphic symbols and class designation letters are based on ANSI Standard Y32.2-1975.

Logic symbology is based on ANSI Y32.14-1973 in terms of positive logic. Logic symbols depict the logic function performed and may differ from the manufacturer's data.

The overline on a signal name indicates that the signal performs its intended function when it is in the low state.

Abbreviations are based on ANSI Y1.1-1972.

Other ANSI standards that are used in the preparation of diagrams by Tektronix, Inc. are:

Y14.15, 1966 Drafting Practices.
Y14.2, 1973 Line Conventions and Lettering.
Y10.5, 1968 Letter Symbols for Quantities Used in Electrical Science and Electrical Engineering.

American National Standard Institute
1430 Broadway
New York, New York 10018

Component Values

Electrical components shown on the diagrams are in the following units unless noted otherwise:

Capacitors = Values one or greater are in picofarads (pF). Values less than one are in microfarads (μF).
Resistors = Ohms (Ω).

The information and special symbols below may appear in this manual.

Assembly Numbers and Grid Coordinates

Each assembly in the instrument is assigned an assembly number (e.g., A20). The assembly number appears on the circuit board outline on the diagram, in the title for the circuit board component location illustration, and in the lookup table for the schematic diagram and corresponding component locator illustration. The Replaceable Electrical Parts list is arranged by assemblies in numerical sequence; the components are listed by component number *(see following illustration for constructing a component number).

The schematic diagram and circuit board component location illustration have grids. A lookup table with the grid coordinates is provided for ease of locating the component. Only the components illustrated on the facing diagram are listed in the lookup table. When more than one schematic diagram is used to illustrate the circuitry on a circuit board, the circuit board illustration may only appear opposite the first diagram on which it was illustrated; the lookup table will list the diagram number of other diagrams that the circuitry of the circuit board appears on.

REPLACEABLE MECHANICAL PARTS

PARTS ORDERING INFORMATION

Replacement parts are available from or through your local Tektronix, Inc. Field Office or representative.

Changes to Tektronix instruments are sometimes made to accommodate improved components as they become available, and to give you the benefit of the latest circuit improvements developed in our engineering department. It is therefore important, when ordering parts, to include the following information in your order: Part number, instrument type or number, serial number, and modification number if applicable.

If a part you have ordered has been replaced with a new or improved part, your local Tektronix, Inc. Field Office or representative will contact you concerning any change in part number.

Change information, if any, is located at the rear of this manual.

SPECIAL NOTES AND SYMBOLS

X000	Part first added at this serial number
00X	Part removed after this serial number

FIGURE AND INDEX NUMBERS

Items in this section are referenced by figure and index numbers to the illustrations.

INDENTATION SYSTEM

This mechanical parts list is indented to indicate item relationships. Following is an example of the indentation system used in the description column.

```
1 2 3 4 5                    Name & Description

Assembly and/or Component
Attaching parts for Assembly and/or Component
        - - - * - - -
  Detail Part of Assembly and/or Component
  Attaching parts for Detail Part
        - - - * - - -
    Parts of Detail Part
    Attaching parts for Parts of Detail Part
        - - - * - - -
```

Attaching Parts always appear in the same indentation as the item it mounts, while the detail parts are indented to the right. Indented items are part of, and included with, the next higher indentation. The separation symbol - - - * - - - indicates the end of attaching parts.

Attaching parts must be purchased separately, unless otherwise specified.

ITEM NAME

In the Parts List, an Item Name is separated from the description by a colon (:). Because of space limitations, an Item Name may sometimes appear as incomplete. For further Item Name identification, the U.S. Federal Cataloging Handbook H6-1 can be utilized where possible.

MANUAL CHANGE INFORMATION

At Tektronix, we continually strive to keep up with latest electronic developments by adding circuit and component improvements to our instruments as soon as they are developed and tested.

Sometimes, due to printing and shipping requirements, we can't get these changes immediately into printed manuals. Hence, your manual may contain new change information on following pages.

A single change may affect several sections. Since the change information sheets are carried in the manual until all changes are permanently entered, some duplication may occur. If no such change pages appear following this page, your manual is correct as printed.

SERVICE NOTE

Because of the universal parts procurement problem, some electrical parts in your instrument may be different from those described in the Replaceable Electrical Parts List. The parts used will in no way alter or compromise the performance or reliability of this instrument. They are installed when necessary to ensure prompt delivery to the customer. Order replacement parts from the Replaceable Electrical Parts List.

CALIBRATION TEST EQUIPMENT REPLACEMENT

Calibration Test Equipment Chart

This chart compares TM 500 product performance to that of older Tektronix equipment. Only those characteristics where significant specification differences occur, are listed. In some cases the new instrument may not be a total functional replacement. Additional support instrumentation may be needed or a change in calibration procedure may be necessary.

Comparison of Main Characteristics

DM 501 replaces 7D13		
PG 501 replaces 107	PG 501 - Risetime less than 3.5 ns into 50 Ω.	107 - Risetime less than 3.0 ns into 50 Ω.
108	PG 501 - 5 V output pulse; 3.5 ns Risetime	108 - 10 V output pulse 1 ns Risetime
PG 502 replaces 107		
108	PG 502 - 5 V output	108 - 10 V output
111	PG 502 - Risetime less than 1 ns; 10 ns Pretrigger pulse delay	111 - Risetime 0.5 ns; 30 to 250 ns Pretrigger pulse delay
PG 508 replaces 114	Performance of replacement equipment is the same or better than equipment being replaced.	
115		
2101		
PG 506 replaces 106	PG 506 - Positive-going trigger output signal at least 1 V; High Amplitude output, 60 V.	106 - Positive and Negative-going trigger output signal, 50 ns and 1 V; High Amplitude output, 100 V.
067-0502-01	PG 506 - Does not have chopped feature.	0502-01 - Comparator output can be alternately chopped to a reference voltage.
SG 503 replaces 190, 190A, 190B	SG 503 - Amplitude range 5 mV to 5.5 V p-p.	190B - Amplitude range 40 mV to 10 V p-p.
191		
067-0532-01	SG 503 - Frequency range 250 kHz to 250 MHz.	0532-01 - Frequency range 65 MHz to 500 MHz.
SG 504 replaces 067-0532-01	SG 504 - Frequency range 245 MHz to 1050 MHz.	0532-01 - Frequency range 65 MHz to 500 MHz.
067-0650-00		
TG 501 replaces 180, 180A	TG 501 - Trigger output-slaved to marker output from 5 sec through 100 ns. One time-mark can be generated at a time.	180A - Trigger pulses 1, 10, 100 Hz; 1, 10, and 100 kHz. Multiple time-marks can be generated simultaneously.
181		181 - Multiple time-marks
184	TG 501 - Trigger output-slaved to market output from 5 sec through 100 ns. One time-mark can be generated at a time.	184 - Separate trigger pulses of 1 and 0.1 sec; 10, 1, and 0.1 ms; 10 and 1 μs.
2901	TG 501 - Trigger output-slaved to marker output from 5 sec through 100 ns. One time-mark can be generated at a time.	2901 - Separate trigger pulses, from 5 sec to 0.1 μs. Multiple time-marks can be generated simultaneously.

NOTE: All TM 500 generator outputs are short-proof. All TM 500 plug-in instruments require TM 500-Series Power Module.

MANUAL CHANGE INFORMATION

Date: 2-5-81 Change Reference: C1/281

Product: PG 507 50 MHz DUAL OUTPUT PULSE GENERATOR Manual Part No.: 070-2962-00

DESCRIPTION

TEXT, ELECTRICAL PARTS LIST AND SCHEMATIC DIAGRAM CHANGES

Section 1-SPECIFICATION

Page 1-2, Table 1-1 ELECTRICAL CHARACTERISTICS

UNDER:

Characteristics	Performance Requirements	Supplemental Information
Rise/Fall Time	≤4 ns fixed from 5 V to 7.5 V p-p into 50 Ω load.	
ADD:		
Leading and trailing pulse coincidence	≤1.5 ns	Typically less than 1 ns

Section 4 - CALIBRATION

Page 4-7, 5. Check OUTPUT B Rise Time, Fall Time, and Aberrations

ADD, step 5.5:

5.5 Check Output Leading and Trailing Edge pulse coincidence. ≤1.5 ns

Refer to Fig 4-3 check setup.

a. With the output cable connected to OUTPUT B, position the rising 50% point of the waveform to the center graticule line.

b. Remove the PG 507 OUTPUT B cable connection and connect to OUTPUT A.

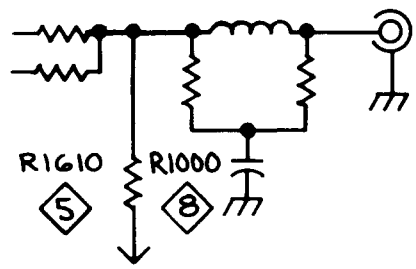
c. Check-The rising 50% points of the output pulses must coincide within 1.5 ns.

d. Repeat steps a, b, and c for the falling 50% points of the output pulses.

ELECTRICAL PARTS LIST AND SCHEMATIC DIAGRAM CHANGES

CHANGE:

F1931 159-0059-00 FUSE, WIRE LEAD:5A, 125V, 18 SEC.

The above part is located on the A14 OUTPUT B circuit board assembly and shown on the POWER SUPPLIES diagram 10.


CHANGE the connection of R1610 and R1000 as shown:
