067-1007-00
CALIBRATION FIXTURE
(KERNEL TEST BOARD)

3706-1

The 067-1007-00 Kernel Test Board is a TEKTRONIX test aid designed for use in troubleshooting certain TM 500/TM 5000 microprocessor-based counters or other instruments. It is used with a signature analyzer to verify signatures in the kernel circuitry (microprocessor, some ROM and RAM, and associated circuit paths).

The Kernel Test Board contains a 6502 microprocessor, two sets of pullup resistors, and four connectors. Four cables are included. The 6502 microprocessor replaces the function of the original microprocessor in the instrument under test (original microprocessor is removed). The Data lines for the Kernel Test Board microprocessor are hardwired to produce a NOP (no operation) instruction code. The Address lines are connected to the instrument's Address lines. The instrument's Data lines are pulled high by the pullup resistors.

The Kernel Test Board connects through J1002 and J1003 and/or J1000 and J1001 to the instrument under test. Specific connection information and signatures are provided in the instruction manual for the instrument under test. TP1000 provides the START/STOP signal for the signature analyzer; GND and CLOCK connections for the analyzer are made to the instrument under test as indicated in its instruction manual. With proper connection to the signature analyzer and the instrument, the Kernel Test Board's microprocessor sequentially addresses each location in the instrument's address space; then this sequence repeats until the instrument is turned off.

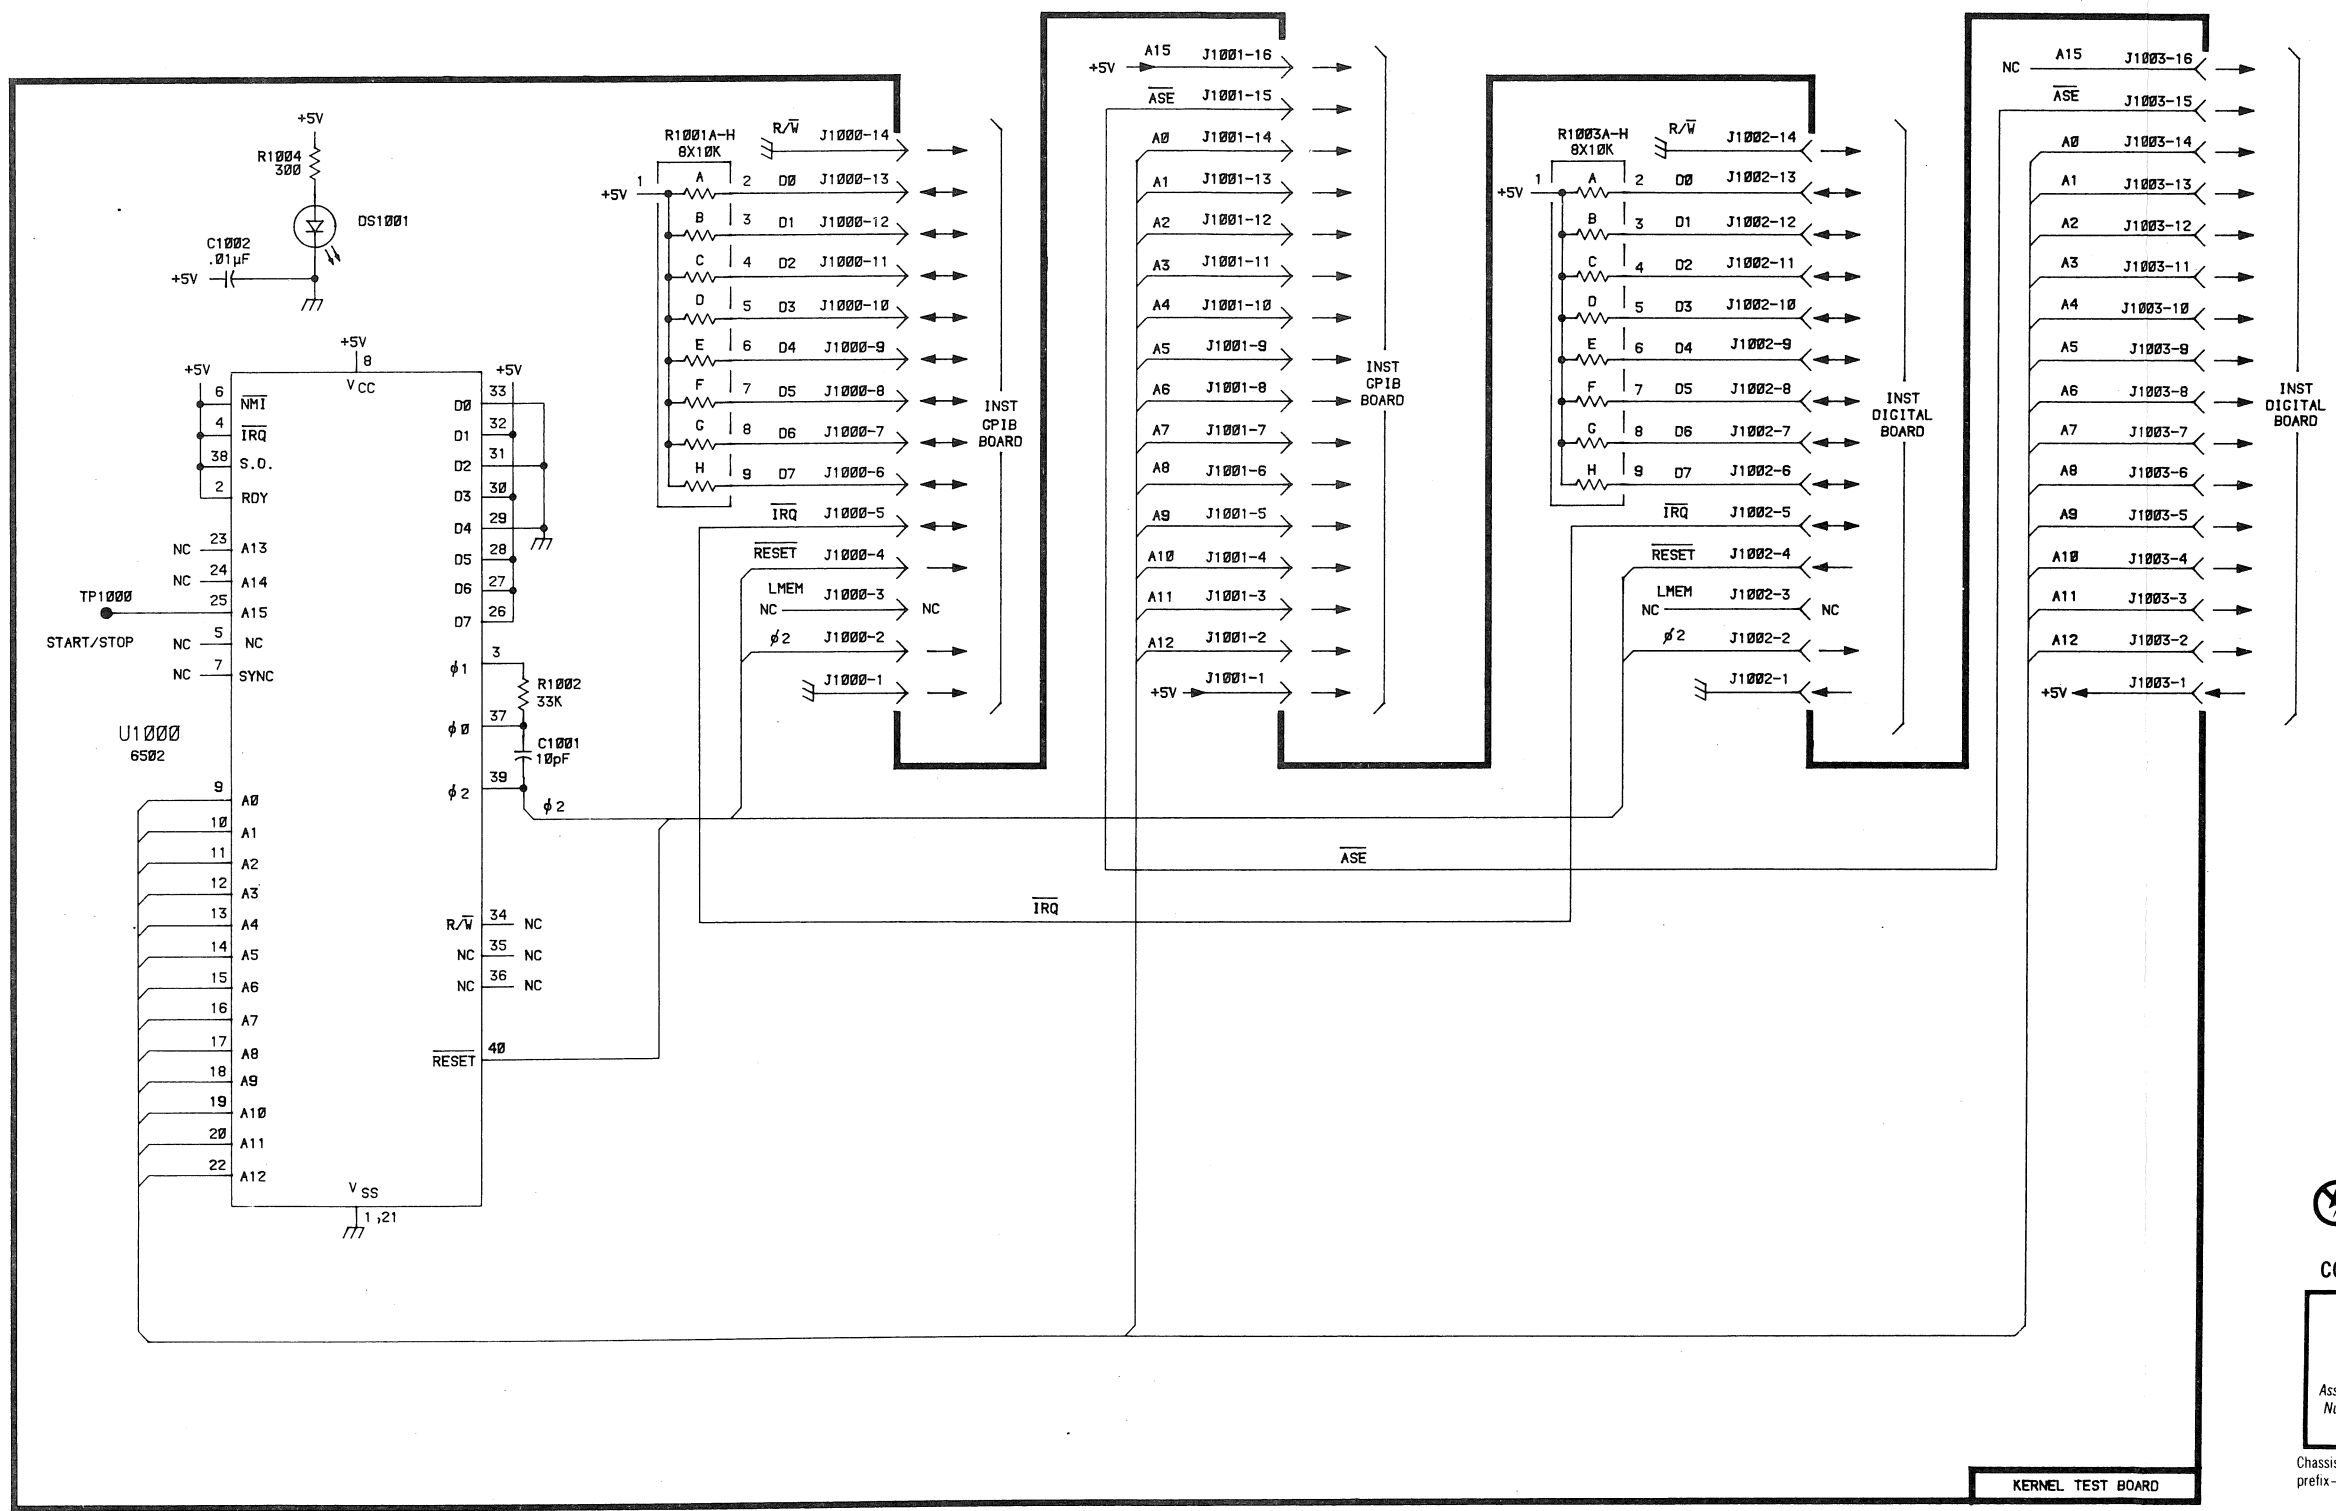

The LED, DS1001, illuminates when +5 V from the instrument under test is applied to the Kernel Test Board.
