TABLE OF CONTENTS

This manual is divided into two parts for safety purposes. Part I should be used by both operating and servicing personnel. Part II is to be used by qualified service personnel only. The service technician should be familiar with the Safety Summary in Part I.

PART I — OPERATOR'S INFORMATION

		Page
SECTION 1	OPERATING INSTRUCTIONS

PART I

OPERATORS INFORMATION

OPERATING INSTRUCTIONS

SAFETY SUMMARY

This manual contains safety information that the operator and service technician must follow to avoid hazardous voltages and to ensure safe operation of the instrument.

WARNING information is intended to protect the operator from hazardous voltages.

CAUTION information is intended to protect the instrument from damage.

The following are general safety precautions that must be observed during all phases of operation and maintenance.

WARNING

To reduce electrical shock hazard, the instrument must be properly grounded. Refer to the 1410 Mainframe manual for more information.

Electrical shock hazards are present inside the instrument. Only qualified service personnel should remove the instrument covers.

DESCRIPTION

The SPG1 and SPG2 NTSC Sync Generators are two-location wide generators of sync and timing signals for the 1410 and 1410 Option 1 NTSC Generator system. All the timing signals required for operation of any of the test signal generator modules in the 1410 system are available from the SPG1 and SPG2.

Parallel outputs of sync and blanking pulses are available at the SPG1 and SPG2 front panels and the 1410 rear panel. The generators also provide Black Burst outputs with the provision of the Vertical Interval Reference Signal (VIRS) on line 18 or 19, or full field.

The SPG1 and SPG2 can both be referenced to an external source of composite sync and subcarrier. The SPG2 can be Gen-Locked to an external composite video signal.

REMOTE OPERATION

Via the Remote connector on the rear panel of the host 1410 Mainframe, the SPG1 and SPG2 can be remotely commanded to change operating modes. Also, status of operating modes and external reference signals are provided as outputs capable of driving LED indicators.

Logic 'low' levels are required for the input switching functions.

Connect LED's between any of the output circuits and chassis ground as status indicators. See Table 1-1.

TABLE 1-1

1410 Remote Connector J41	SPG1 or SPG2 Function
Pin 25	Subcarrier Absent Output
Pin 26	In Internal Mode Output
Pin 27	Sync Absent Output
Pin 29	Internal Mode Input
Pin 30	External Mode Input
Pin 31	Genlock Mode Input
Pin 36	Chassis Ground

FRONT-PANEL CONTROLS (Refer to Figs. 1-1 and 1-2)

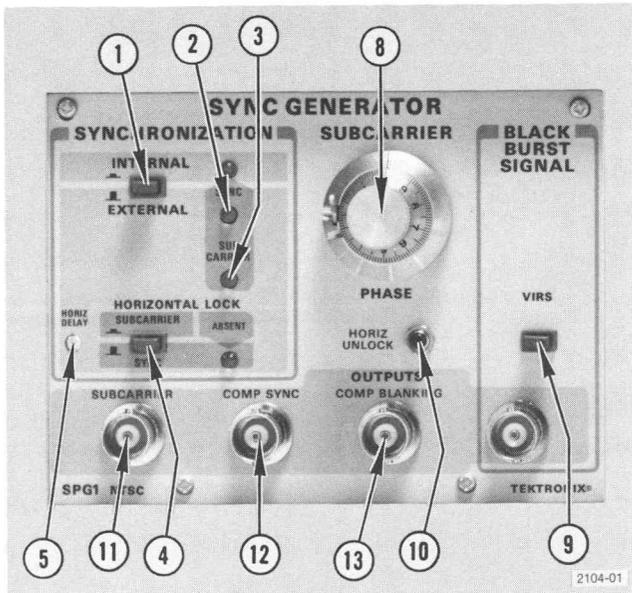

Fig. 1-1. SPG1 front-panel controls.

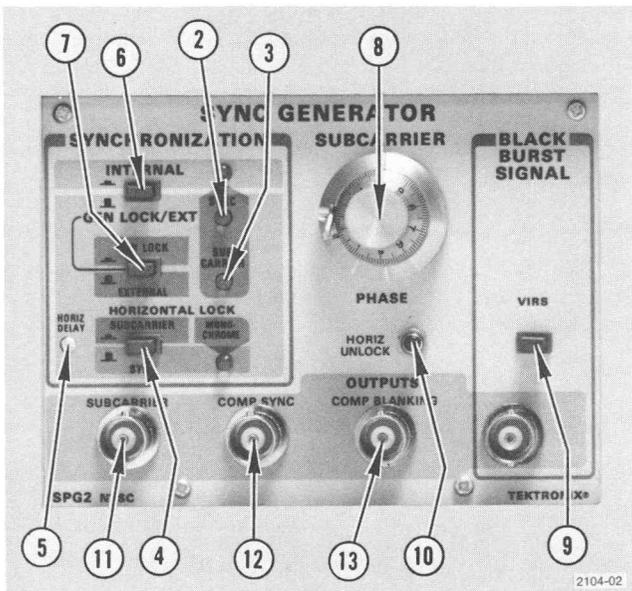

Fig. 1-2. SPG2 front-panel controls.

SYNCHRONIZATION

① **INTERNAL-EXTERNAL**—Selects INTERNAL reference (button pressed in), or external source of composite sync and subcarrier (button out). INTERNAL LED lights when INTERNAL reference is selected.

② **SYNC**—LED indicates absence of composite sync in EXTERNAL mode. Loss of incoming composite sync automatically causes the SPG1 to switch to internal sync reference or to full internal gen (determined by internal plug-jumper). If HORIZONTAL LOCK is in the SYNC mode, full internal gen is always selected when incoming sync is lost. The user can select (via internal plug-jumper) to cause loss of incoming sync to inhibit all signals. The SYNC LED may be lit or out at the user's discretion.

③ **SUBCARRIER**—LED indicates absence of subcarrier in external mode. Loss of incoming subcarrier causes the SPG1 to automatically switch to full internal gen or lock to sync. The user can elect (via internal plug-jumper) to cause loss of incoming subcarrier to inhibit subcarrier on all signals. The SUBCARRIER LED may be lit or out at the user's discretion.

HORIZONTAL LOCK

④ **SUBCARRIER-SYNC**—Selects either incoming subcarrier or composite sync to phase-lock the timing generator clock oscillator on sync timing board A20. The SPG1 automatically switches reference to incoming composite sync if subcarrier is absent and the SPG1 is not programmed to switch to full internal on loss of subcarrier, causing the SYNC LOCK LED to light. The SYNC LOCK indicator is lit if locked to sync.

⑤ **HORIZ DELAY**—Delays the output sync $\pm 1/2 \mu s$ with respect to external input sync. A wider range ($+4 \mu s, -10 \mu s$) can be selected via internal switch.

⑥ **INTERNAL-GEN LOCK/EXT**—Selects INTERNAL reference (button pressed in) or external signal source (button out). The INTERNAL indicator is lit in the INTERNAL mode.

⑦ **GEN LOCK-EXTERNAL**—In the GEN LOCK/EXT mode, the GEN LOCK-EXTERNAL switch selects either an external source of composite sync and subcarrier (EXTERNAL, button out) or an external source of composite video (GEN LOCK, button in). SYNC and SUBCARRIER indicators respond to loss of the corresponding signal or portion of the signal in both modes. The LED indicator may be lit or out for loss indication at the user's discretion. With signal loss, the SPG2 switches to internal sync reference or to full internal gen. If HORIZONTAL LOCK is in the SYNC mode, full internal gen is always selected when sync is lost. Loss of subcarrier switches the SPG2 to full internal gen or to sync lock.

TEST EQUIPMENT

The test equipment listed here was used in preparing this procedure. The measurement capabilities described are the minimum required to verify instrument performance. Each piece of test equipment is assumed to be operating within its stated specifications. If alternative equipment is used, it must meet or exceed these requirements.

1. Test Oscilloscope

Dual Time Base. Range from 50 ns/Div to 5 s/Div with provisions for a delaying sweep and television triggering.

Differential Comparator. Bandwidth, dc to 30 MHz; minimum deflection factor, 1 mV/Div; two channels capable of differential operation.

Dual Trace Amplifier. Vertical amplifier independent of the Differential Comparator. Bandwidth, dc to 30 MHz; minimum deflection factor, 5 mV/Div) e.g., a Tektronix 7603 with 7B53A Option 5 Dual Time Base, 7A13 Differential Comparator, and 7A18 Dual Trace Amplifier.

2. Leveled Sine Wave Generator

Capable of amplitudes from 0.2 to 5 volts peak-to-peak; frequency range, from 50 kHz to 5 MHz (e.g., a Tektronix SG 503 in a TM 500-series Power Unit).

3. Return Loss Bridge

Tektronix Part No. 015-0149-00.

4. 50 Ω to 75 Ω Minimum Loss Attenuator

Tektronix Part No. 011-0057-00.

5. 75 Ω Feed-through Termination

Two, matched within 0.2%, supplied as accessories with the Return Loss Bridge (Item 3). Tektronix Part No. 011-0103-00 (red), and 011-0103-01 (green).

6. 75 Ω Feed-through Termination (2)

Tektronix Part No. 011-0103-02.

7. 75 Ω Cable (5)

42 inches long. Tektronix Part No. 012-0074-00.

8 PHASE—Varies the phase of the subcarrier portion of the output signals, and the subcarrier signal at the rear-panel SUBCARRIER connector, 360° with respect to incoming subcarrier and subcarrier at the front-panel connector.

9 VIRS On-Off (pressed in—VIRS on, released—VIRS off)—Selects the Vertical Interval Reference Signal (VIRS) on line 18 or 19 of either or both fields at the BLACK BURST SIG output connector.

10 HORIZ UNLOCK—Momentary-closure pushbutton unlocks H sync from subcarrier. For testing subcarrier packet risetimes, etc.

CONNECTORS

11 SUBCARRIER—2 V p-p of 3.579545 MHz subcarrier from the selected source (internal or external).

12 COMP SYNC—4 V of negative-going composite sync.

13 COMP BLANKING—4 V of negative-going composite blanking.

PERFORMANCE CHECK

This procedure is to be used to verify that the SPG1 or SPG2 is performing to specifications. None of the checks in this procedure involve any internal adjustments or operating changes. Do not remove the protective covers.

This procedure assumes no changes to factory-set operating modes.

Control and connector titles on the SPG1 or SPG2 are capitalized in this procedure, for example: HORIZ UNLOCK. Controls and connectors on test equipment or the 1410 Mainframe and any modules installed in the Mainframe have only their first letter capitalized, for example: Test Oscilloscope Time/Div, or 1410 rear-panel Gen Lock loop-through connector.

Operating Instructions—SPG1/SPG2

8. A test signal generator module (TSG1, TSG2, TSG3, TSG4) mounted in the 1410 along with the SPG1 or SPG2. The test signal generator signal must contain a subcarrier portion at 0 APL with more than 19 cycles of subcarrier.

9. Video Signal Source

Capable of generating composite video, composite sync, and a 2 volt peak-to-peak subcarrier signal (e.g., a Tektronix 1410 with SPG1 or SPG2; or a Tektronix 146).

10. Waveform Monitor

Capable of overlaying one portion of a line sweep display on another portion and having sweep magnification to at least $0.1 \mu\text{s}/\text{div}$ (e.g., a Tektronix 1480-series).

11. Vectorscope

Capable of measuring phase differences between two signals of less than 0.5° (e.g., a Tektronix 520A).

12. Spectrum Analyzer

Capable of measuring the third harmonic of the color subcarrier to below -30 dB (e.g., a Tektronix 7L12 or 7L5/L2, 7000-series plug-in unit).

13. Frequency Counter

Capable of resolving 0.25 Hz out of 3 MHz, (e.g., a Hewlett-Packard 5326A Option 011).

14. Calibration Fixture

For use with the waveform Monitor. See Fig. 1-3.

EQUIPMENT SETUP

PROCEDURE

1. Check HORIZ DELAY Range

a. Display composite video from the Video Signal Source and from the 1410 Test Signal Module simultaneously on the Test Oscilloscope. Externally trigger the Test Oscilloscope with the composite from the Video Signal Source.

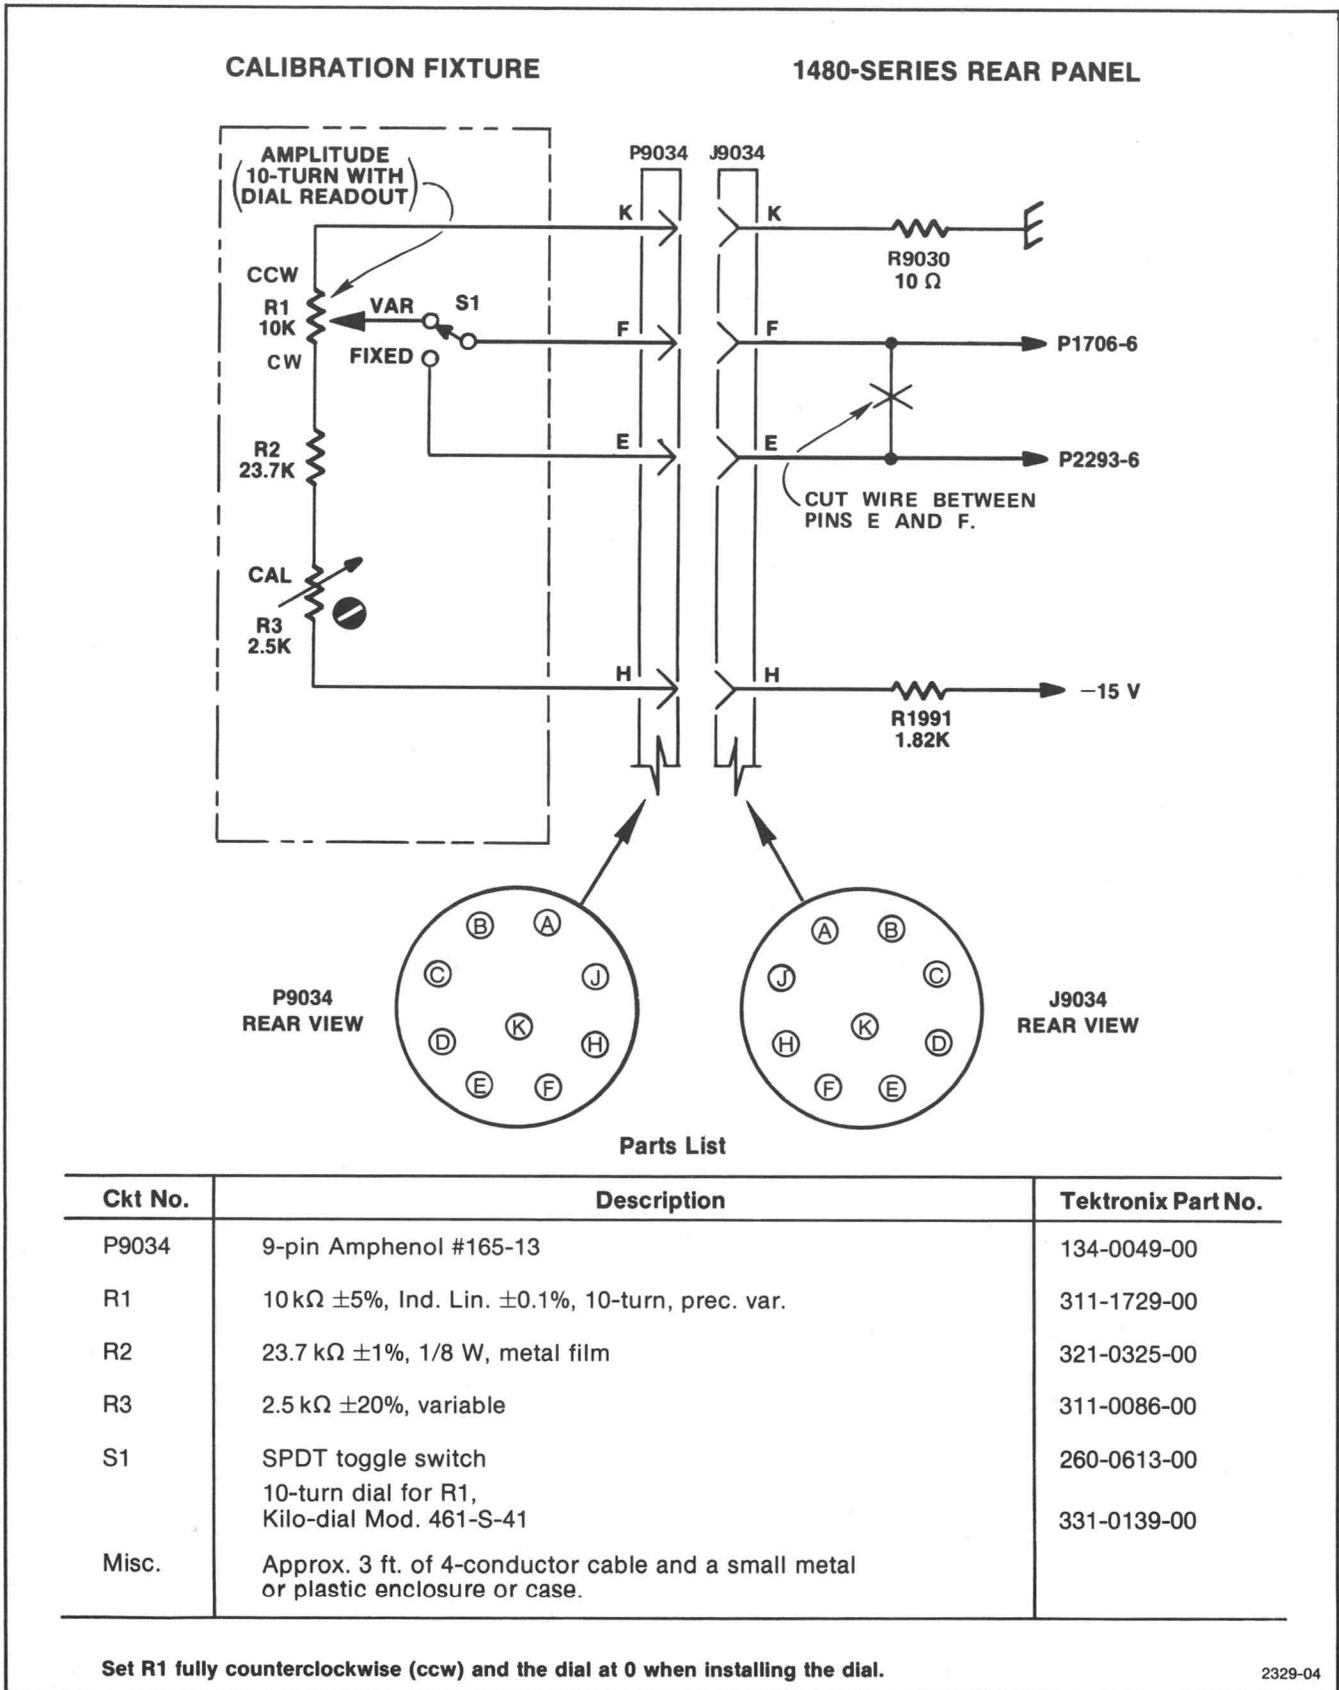

Fig. 1-3. Waveform Monitor Calibration Fixture.

Operating Instructions—SPG1/SPG2

b. Check—The leading edges of the two displayed line sync pulses should coincide.

c. Adjust—HORIZ DELAY (R175) until the sync pulses leading edges coincide.

2. Check Vertical Phasing

a. Set the Test Oscilloscope Dual Time Base Time/Div to 2 ms. Use the delaying sweep to view the vertical intervals of the two signals.

b. Check—The two displayed signals should coincide.

3. Check Field Blanking Duration (Variable)

a. Display the SPG1 or SPG2 COMP BLANKING output and composite video from the Video Signal Source simultaneously on the Test Oscilloscope.

b. Set the Test Oscilloscope Time/Div and Delayed Sweep Time/Div to view the vertical interval.

c. Check—The duration of the field blanking pulse should be 20 lines.

4. Check Line Blanking Duration (Variable)

a. Display signals from the SPG1 or SPG2 front-panel COMP BLANKING connector and the 1410 rear-panel H Drive connector simultaneously on the Test Oscilloscope.

b. Set the Test Oscilloscope Time/Div to display a horizontal line.

c. Check—Fixed line blanking duration should be $10.7 \mu\text{s}$ as measured at the 50% amplitude point on the signal.

5. Check Burst Delay and Burst Width

a. Display the SPG1 or SPG2 BLACK BURST and SUBCARRIER signals simultaneously on the Test Oscilloscope.

b. Using the Test Oscilloscope delayed sweep function, view the line sync area with the main sweep at a field rate and the delayed sweep at about $2 \mu\text{s}$.

c. Check—The time between the leading edge of line sync and the start of burst (50% points from the blanking level) should be equal to the duration of 19 cycles of subcarrier.

d. Check—Burst width should be 9 cycles of subcarrier.

e. Check—The breezeway should be 425 ns to 525 ns in width as measured from the 10% amplitude point on sync to the 50% amplitude point of burst.

f. Check—The front porch should be $1.4 \mu\text{s}$ in width as measured at the 50% amplitude points on sync and setup with respect to blanking.

6. Check Sync Timing

a. Display the SPG1 or SPG2 COMP SYNC signal on the Test Oscilloscope.

b. Using the Test Oscilloscope delayed sweep function, view the vertical interval area of the signal.

c. Check—Sync timing as follows:

Line sync duration	$4.70 \mu\text{s}$ $\pm 100 \text{ ns}$	measured at 50% points
Equalizing pulse duration	$2.3 \mu\text{s}$ $\pm 100 \text{ ns}$	measured at 50% points
Interval between sync pulses	$4.77 \mu\text{s}$ $\pm 100 \text{ ns}$	measured at 50% points
Field sync pulse	6 equalizing pulses—6 sync pulses—6 equalizing pulses	

7. Check SCH ϕ Center

a. Display a composite video signal from the Video Signal Source on the Waveform Monitor. The displayed signal must contain at least 19 cycles of subcarrier on the 0 APL level.

b. Set the Waveform Monitor Field switch to 1, Display to $10 \mu\text{s}/\text{Div}$, Line Selector to Digital and Line 17, and Sync to External and Direct.

c. Externally trigger the Waveform Monitor with comp sync from the Video Signal Source.

d. Using the Waveform Monitor Waveform Comparison controls, overlay the second line sync pulse on the first line subcarrier.

e. Using the Waveform Monitor Vertical Position control, place the 50% amplitude point of the sync pulse on a reference line.

f. Rotate the Video Signal Source Subcarrier Phase control to place the zero crossing point of the positive-going slope of a cycle of subcarrier on the reference line.

g. Display the Waveform Monitor Line Strobe Out and the Field Ref signal from the 1410 rear panel simultaneously on the Test Oscilloscope.

h. Check—The two pulses displayed on the Test Oscilloscope should be field coincident.

i. Check—The Field Ref signal from the 1410 rear panel should shift one frame in time with each rotation of the Video Signal Source Subcarrier Phase control.

8. Check Subcarrier To Sync Lock Timing

a. Display the SPG1 or SPG2 BLACK BURST signal on the Test Oscilloscope. The SPG1 or SPG2 should still be in an external lock mode.

b. Externally trigger the Test Oscilloscope from the Video Signal Source.

c. Check—The display shift should be less than 100 ns as the HORIZONTAL LOCK is switched between SUBCARRIER and SYNC.

d. Set the SPG1 or SPG2 to INTERNAL.

e. Trigger the Test Oscilloscope internally.

f. Press the SPG1 or SPG2 front-panel HORIZONTAL UNLOCK button.

g. Check—The subcarrier portion of the displayed signal should free run.

9. Check INTERNAL Mode Operation

a. Connect composite sync, subcarrier, and composite video from the Video Signal Source to the appropriate 1410 rear-panel loop-through connectors.

b. Set the SPG1 or SPG2 for INTERNAL operation.

c. Display the SPG1 or SPG2 BLACK BURST signal and a signal from the Video Signal Source simultaneously on the Test Oscilloscope. Trigger the Test Oscilloscope externally from the Video Signal Source.

d. Check—The front-panel INTERNAL LED should be lit and the two signals displayed on the Test Oscilloscope should not be locked.

10. Check SYNC Lock EXTERNAL Mode Operation

a. Set the SPG1 or SPG2 for EXTERNAL operation. Set the HORIZONTAL LOCK Switch to SUBCARRIER.

b. Check—The SYNC and SUBCARRIER LED's indicate the presence of external sync and subcarrier.

c. Check—The two signals displayed on the Test Oscilloscope should be locked.

d. Remove composite sync from the 1410 rear-panel loop-through connector.

e. Check—The SYNC LED should change states and the two signals displayed on the Test Oscilloscope should remain locked.

f. Release HORIZONTAL LOCK switch.

g. Check—SYNC LOCK and INTERNAL LED's should light and the two signals displayed on the Test Oscilloscope should not be locked.

h. Connect composite sync to the appropriate 1410 rear-panel loop-through connector.

11. Check—SUBCARRIER Lock EXTERNAL Mode Operation

a. Set the SPG1 or SPG2 HORIZONTAL LOCK to SUBCARRIER.

b. Remove the subcarrier signal from the 1410 rear-panel loop-through connector.

c. Check—The SUBCARRIER LED should indicate the absence of external subcarrier, the SYNC LOCK LED should be lit, and the two signals displayed on the Test Oscilloscope should remain locked.

d. Connect subcarrier to the 1410 rear-panel loop-through connector.

12. Check GEN LOCK Mode (SPG2 only)

a. Set the SPG2 for GEN LOCK operation.

Operating Instructions—SPG1/SPG2

b. Remove composite sync from the Video Signal Source composite video signal.

c. Check—The SYNC and SUBCARRIER LED's should change states and the INTERNAL LED should be lit.

d. Restore composite sync to the Video Signal Source composite video signal.

e. Remove burst from the Video Signal Source composite video signal.

f. Check—The SUBCARRIER LED should change states and the SYNC LOCK LED should be lit.

g. Restore burst to the Video Signal Source composite video.

13. Check Subcarrier Phase

a. Connect the SPG2 BLACK BURST signal to the Vectorscope.

b. Lock the Vectorscope to the Video Signal Source subcarrier.

c. Check—The burst phase displayed on the Vectorscope should not vary more than $\pm 3^\circ$ as the input signal amplitude is varied from one-half to two times nominal (1 V).

14. Check Phase Stability with Dynamic APL

a. Apply a composite video signal that is variable in Average Picture Level from the Video Signal Source to the 1410 rear-panel Gen Lock loop-through input.

b. Check—The phase of the signal displayed on the Vectorscope should change by 0.1° or less as the input APL is varied from 10% to 90%.

15. Check SUBCARRIER PHASE Range

a. Rotate the SPG2 SUBCARRIER PHASE control.

b. Check—The phase of the signal displayed on the Vectorscope should change 360° for each 360° rotation of the SUBCARRIER phase control.

16. Check Horizontal Jitter

a. Display the SPG2 BLACK BURST signal on the Test Oscilloscope.

b. Externally trigger the Test Oscilloscope with composite sync from the Video Signal Source.

c. Using the Test Oscilloscope delayed sweep function and magnifier, view the leading edge of a line sync pulse at 20 ns/div ($.2 \mu\text{s}/\text{div} \times 10 \text{ mag}$).

d. Check—With the SPG2 HORIZONTAL LOCK in SYNC, jitter on the sync pulse leading edge should be 10 ns or less. With HORIZONTAL LOCK in SUBCARRIER, jitter should not exceed 4 ns.

17. Check Oscillator Frequency

NOTE

After initial shipment or long storage, allow approximately 2-hour warm-up period to re-age the crystal. Thereafter, 10 to 20 minutes warm-up is sufficient.

a. Remove the composite video signal from the 1410 rear-panel Gen Lock loop-through connector.

b. Connect the SPG2 SUBCARRIER output to the Frequency Counter.

c. Check—Subcarrier frequency should be within 10 Hz of 3.579545 MHz if the SPG2 is installed in a 1410, or within 1 Hz of 3.579545 MHz if the SPG2 is installed in a 1410 Option 1.

18. Check Subcarrier Amplitude

a. Connect one of the 1410 rear-panel Subcarrier outputs through 75Ω termination to the Test Oscilloscope input.

b. Check—The Subcarrier signal should be 1.8 volts peak-to-peak to 2.2 volts peak-to-peak in amplitude.

c. Check—The other 1410 rear-panel Subcarrier output should be as in step b.

d. Connect the SPG1 or SPG2 SUBCARRIER output through 75Ω termination to the Test Oscilloscope input.

NOTE

The SPG1 or SPG2 SUBCARRIER output is driven directly from the Subcarrier Output Amplifier on the 1410 Subcarrier Input board, A13. This output is provided as a subcarrier phase reference. The subcarrier signal phase at the SPG1 or SPG2 front panel cannot be varied with the SUBCARRIER PHASE control, but is always the same as the reference subcarrier (either from the 1410 Subcarrier Oscillator or from an external source).

e. Check—The SUBCARRIER signal amplitude should be 1.8 volts peak-to-peak to 2.2 volts peak-to-peak.

19. Check Comp Blanking Compensation

a. Connect the SPG1 or SPG2 COMP BLANKING output through 75 Ω termination to the Test Oscilloscope input.

b. Check—The signal amplitude should be 3.8 volts to 4.2 volts.

c. Check—Risetime and falltime should each be 120 ns to 160 ns.

d. Repeat this step for each of the two 1410 rear-panel Comp Blanking outputs.

20. Check Comp Sync Compensation

a. Connect the SPG1 or SPG2 COMP SYNC output through 75 Ω termination to the Test Oscilloscope input.

b. Check—The signal amplitude should be 3.8 volts to 4.2 volts.

c. Check—Risetime and falltime should each be 120 ns to 160 ns.

d. Repeat this step for each of the two 1410 rear-panel Comp Sync outputs.

21. Check Burst Flag Compensation, Burst Flag Delay, and Burst Flag Width

a. Connect the 1410 rear-panel Burst Flag output through 75 Ω termination to the Test Oscilloscope input.

b. Check—The signal amplitude should be 3.8 volts to 4.2 volts.

c. Check—Risetime and falltime should each be 120 ns to 160 ns.

d. Externally trigger the Test Oscilloscope with the SPG1 or SPG2 COMP SYNC signal.

e. Connect one of the 1410 rear-panel Comp Sync outputs through 75 Ω termination to the Test Oscilloscope so that comp sync and burst flag are displayed simultaneously.

f. Note the position of the leading edge of line sync.

g. Check—The leading edge of the Burst Flag pulse should be 5.3 μ s \pm 35 ns from the leading edge of line sync.

h. Check—The half-amplitude width of the Burst Flag pulse should be 2.5 μ s \pm 70 ns.

22. Check H Drive Compensation

a. Connect 1410 rear-panel H Drive output J16 through 75 Ω termination to the Test Oscilloscope input.

b. Check—The signal amplitude should be 3.8 volts to 4.2 volts.

c. Check—Risetime and falltime should each be 120 ns to 160 ns.

d. Repeat this step for H Drive output J15 on the 1410 rear panel.

23. Check V Drive Compensation

a. Connect 1410 rear-panel V Drive output J18 through 75 Ω termination to the Test Oscilloscope input.

b. Check—The signal amplitude should be 3.8 volts to 4.2 volts.

c. Check—Risetime and falltime should be 120 ns to 160 ns.

d. Repeat this step for V Drive output J19 on the 1410 rear panel.

Operating Instructions—SPG1/SPG2

24. Check Field Reference Compensation

a. Connect the 1410 rear-panel Field Ref output J14 through 75 Ω termination to the Test Oscilloscope input.

b. Connect the SPG1 or SPG2 BLACK BURST signal through 75 Ω termination to the other Test Oscilloscope input.

c. Externally trigger the Test Oscilloscope with V Drive from the 1410 rear panel.

d. Check—The Field Reference signal amplitude should be 3.8 volts to 4.2 volts.

NOTE

The Field Reference pulse is on either Field 1, line 11, or Field 3, line 10.

e. Check—Risetime and falltime should each be 120 ns to 160 ns.

25. Check VIRS Amplitude

a. Connect the Black Burst output connector to the 1480 Ch A input and terminate in 75 Ω . Set the VIRS pushbutton in the on position.

NOTE

If the SPG1 or SPG2 is internally set for full field reference, do not use the 1480 Line Selector function. If the VIRS is not set for full field, use the 1480 Line Selector to find the VIRS on line 18 or line 19.

b. Set the 1480 display to 10 μ s/div, Volts Full Scale to 0.5, and push in the Cal and Oper switches.

c. Check—Using the Amplitude dial of the Calibration Fixture to match the sync tip with blanking, read 286 mV \pm 3.6 mV.

26. Check DC Level

a. Set the 1480 Volts Full Scale to 1.0, Display to 10 μ s/div, push in the Oper switch, set the DC Restorer Off and Response switch to Aux Video In. Position the trace to the 0 IRE graticule line and change the Black Burst output cable to the Aux Video In connector.

b. Check—The waveform blanking level should be 0 V \pm 50 mV (\pm 7 IRE).

c. Return the Black Burst output cable to the 1480 Ch A input connector.

27. Check VIRS Luminance Levels

a. Check—Use the Calibration Fixture to read the following:

Setup Level—53.57 mV \pm 3.57 mV

Gray Level—357 mV \pm 3.57 mV

Chrominance Pedestal—500 mV \pm 5 mV

28. Check VIRS Luminance Risetime

a. Set the 1480 to measure risetime—Mag at .1 μ s/div.

b. Check—Luminance risetime should be 250 ns \pm 37.5 ns.

Graticule A has built-in risetime and falltime measurement capability. Point R at 80 IRE Units aligns with T on the 0 IRE Unit reference line.

To measure risetime or falltime, set the transition amplitude to 100 IRE Units (use the VARIable Volts Full Scale). Vertically position the display so that the transition is from the -10 IRE Units line to the +90 IRE Units line. Use the 100 ns/div time base and horizontally position the rise (or fall) of the transition through point R on the short 2 IRE Unit/div scale. Measure the distance from point T on the 0 IRE Unit reference line to where the transition crosses the reference line.

29. Check Sync Risetime

a. Check—Sync risetime should be 130 ns \pm 20 ns \pm 10 ns.

30. Check Burst Risetime

a. Push in the HORIZ UNLOCK pushbutton on the SPG front panel. Push in the INTERNAL/EXTERNAL pushbutton.

b. Check—Burst risetime should be 400 ns \pm 60 ns.

31. Check VIRS Chrominance Risetime

- a. Push in the HORIZ UNLOCK pushbutton on the SPG front panel.
- b. Check—Chrominance risetime should be $1 \mu\text{s} \pm 150 \text{ ns}$.
- c. Release the SPG HORIZ UNLOCK button.

32. Check Chrominance Bandpass Filter

- a. Connect the Black Burst output to the Spectrum Analyzer and display the chrominance signal.
- b. Check—Third order harmonics should be -30 dB .

33. Check Residual Subcarrier

- a. Set the 1480 VFS to 0.2 and position the blanking level at the 0 IRE graticule line.
- b. Check—Residual subcarrier should be 2.5 mV or less.

34. Check Chrominance Amplitude

- a. Set the 1480 to Cal mode. Use the Calibration Fixture Amplitude control to position the top and bottom of the chrominance packet to the blanking level. Subtract the two readings to obtain the actual amplitude.
- b. Check—Chrominance amplitude should be $285.7 \text{ mV} \pm 2.86 \text{ mV}$ and the bottom of the chrominance packet should be even with the gray level.

35. Check Black Burst Setup Level

- a. Display the Black Burst signal on the 1480.
- b. Check—Setup level should be $53.57 \text{ mV} \pm 3.57 \text{ mV}$.

36. Check Black Burst Timing

- a. Check—Refer to Fig. 1-4 for timing details.

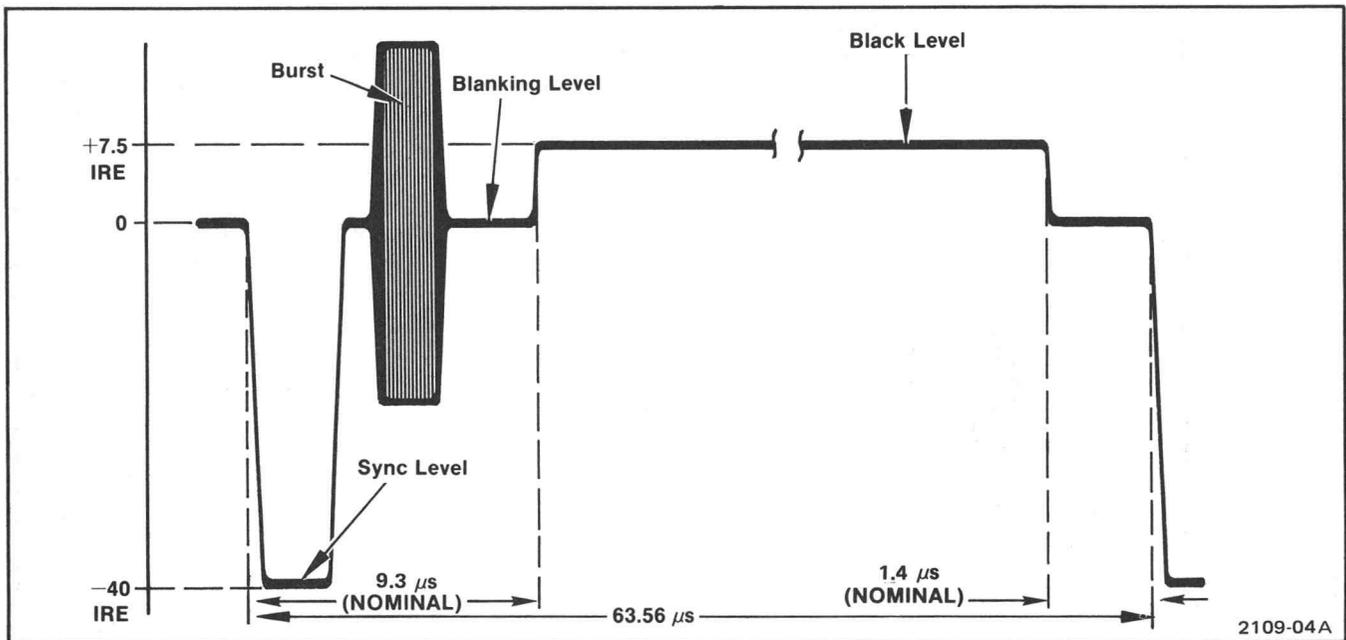

Fig. 1-4. Black Burst timing details.

37. Check Subcarrier Phase

a. Connect the 1410 Mainframe subcarrier output to the vectorscope CW Ext ϕ Ref input. Connect the other Ext ϕ Ref input to Ch B through the 10X attenuator pad. Connect the BLACK BURST output to Ch A. Display Ch A and Ch B.

b. Use the Vectorscope Line Selector to display the VIRS if not in full field mode.

c. Check—VIRS subcarrier phase is within 0.5° of the SPG1 or SPG2 burst phase.

38. Check VIRS Timing

a. Display the VIRS on the 1480.

b. Check—Refer to Fig. 1-5 (in the Operating Instructions section) for timing details.

39. Check Return Loss

a. Remove all connections from the SPG1 or SPG2, the 1410, and the Test Oscilloscope.

b. Set the SPG1 or SPG2 for INTERNAL operation.

c. Trigger the Test Oscilloscope internally.

d. Connect the Return Loss Bridge to the Test Oscilloscope Differential Comparator.

e. Connect the Leveled Sine Wave Generator through 50Ω to 75Ω Minimum Loss Attenuator to the Return Loss Bridge input.

f. Set the Leveled Sine Wave Generator Frequency Range to Ref (5 MHz), and the Test Oscilloscope Volts/Div to .1 V. Set the Differential Comparator for differential operation.

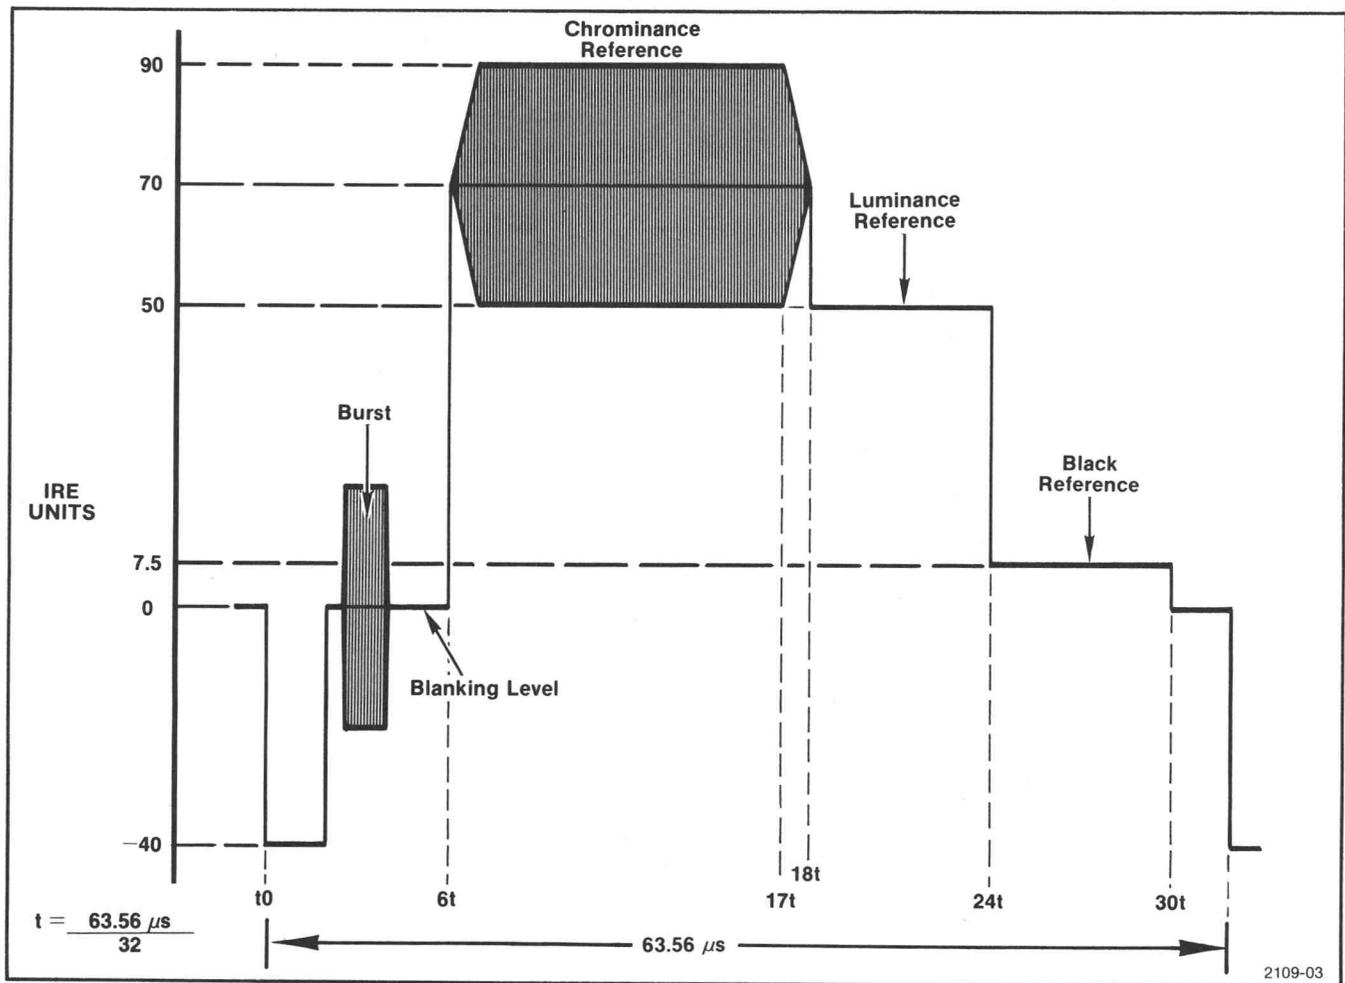

Fig. 1-5. VIRS timing details.

g. Remove the 75 Ω termination from the Return Loss Bridge Unknown arm and adjust the Leveled Sine Wave Generator Output Amplitude control for 500 mV display amplitude.

h. Replace the 75 Ω termination on the Return Loss Bridge Unknown arm.

i. Set the Test Oscilloscope Volts/Div to 10 mV.

j. Adjust the Return Loss Bridge Balance control for minimum display amplitude.

k. Remove the 75 Ω termination from the Return Loss Bridge Unknown arm.

l. Check return loss of all outputs on the SPG1 or SPG2 front panel and the 1410 rear panel (except SUB-CARRIER) by connecting the unterminated Unknown arm to each connector and checking the Test Oscilloscope display amplitude for 16 mV or less.

m. Check return loss of the loop-through inputs on the 1410 rear panel by connecting the Unknown arm to one side of the loop-through connector and the 75 Ω termination to the other side. Check for 3 mV display amplitude.

n. Remove the Return Loss Bridge.

40. Check Isolation

a. Check all double and triple outputs for active and passive isolation in the following manner:

Passive Isolation. Connect the output of interest through 75 Ω termination to the Test Oscilloscope input. Observe the signal amplitude at that output while shorting another output of the same signal to ground. The observed signal amplitude should change by no more than 1%.

Active Isolation. Observe the output of interest on the Test Oscilloscope while introducing a subcarrier signal into another output of the same signal. The subcarrier signal should be attenuated at the observed output by at least 40 dB. The introduced subcarrier signal amplitude should be varied from 0.5 to 4.0 volts.

SPECIFICATIONS

ELECTRICAL CHARACTERISTICS

The performance requirements listed here apply over an ambient temperature range of 0°C to +50°C. The rated accuracies are valid when the instrument is calibrated at +20°C to +30°C with ten minutes warm-up time. A twenty minute warm-up is required for rated accuracies 0°C ambient temperature.

Characteristics	Performance Requirements	
	SPG1	SPG2 Only
GEN LOCK	Does Not Apply	
Input Configuration		75 Ω loop-through
Input Requirements		
Sync Source		1 V nominal composite video or black burst, sync negative.
Sync Amplitude		286 mV \pm 6 dB.
Burst Amplitude		286 mV \pm 12 dB.
Burst/Sync Ratio		Within 6 dB.
Return Loss		\geq -46 dB to 5 MHz.
Loss of Lock		Indicated by front-panel LED's (automatic switching to full or partial internal).
Gen-Locked Subcarrier		
Phase error with Frequency Change		Within 0.5° with input burst frequency change of \pm 10 Hz.
Phase Error with Temperature Change (input burst within 10 Hz of nominal, oven temperature in normal range).		Within 5° with ambient temperature change from 0°C to 50°C, within 1° for any 10°C increment from 0°C to 50°C.
Phase Error with Burst Amplitude Change (input burst frequency within 10 Hz of nominal, oven temperature in normal range, ambient temperature +20°C).		\pm 1° with amplitude change from 210 mV to 420 mV, \pm 3° with amplitude range from 75 mV to 1.2 V.
Phase Stability (Breezeway Effect)		0.2° for burst timing errors including burst width variance (8 to 10 cycles) and breezeway variance (+0.28 μ s).
Phase Stability with Dynamic APL		0.1° or less with APL change from 10% to 90%.
Phase Stability with Noise		Within 1° with rms white noise at 24 dB below nominal p-p picture signal (nominal 714 mV).
Chroma Phase Range		360° via front-panel goniometer.
Line Sync Delay Range		Internal switch sets delay range to +10 μ s, -4 μ s. Front panel range \pm 1/2 μ s.

Specifications—SPG1/SPG2

Characteristics	Performance Requirements	
	SPG1 EXT—SPG2 GEN LOCK & EXT	
Stability (over ambient temperature range 0° C to 50° C).

WARNING

THE FOLLOWING SERVICING INSTRUCTIONS ARE FOR USE BY QUALIFIED PERSONNEL ONLY. TO AVOID PERSONAL INJURY, DO NOT PERFORM ANY SERVICING OTHER THAN THAT CONTAINED IN OPERATING INSTRUCTIONS UNLESS YOU ARE QUALIFIED TO DO SO. REFER TO OPERATORS SAFETY SUMMARY AND SERVICE SAFETY SUMMARY PRIOR TO PERFORMING ANY SERVICE.

PART II

SERVICE INFORMATION

INSTALLATION

INSTALLATION IN MAINFRAME

Use the following steps to install the SPG1 or SPG2 in the 1410 Generator mainframe. Turn the 1410 Power switch off and remove the power cord before installation. Refer to Fig. 3-1 as installation is performed.

1. The rows of pins on the 1410 Interface board are labeled beginning with P51 on the front left of the board. Note that, unlike the test signal modules, which can be placed in any location, the SPG1 or SPG2 must be installed in the two locations immediately to the right of the 1410 front panel.

Starting with row P51, install the boards in the following order:

P51 Pulse Output Amplifier A24
 P52 Sync Lock A21
 P53 Generator Logic A22
 P54 Sync Timing A20
 P56 Subcarrier Lock A23 (SPG2 only)
 P57 VIRS/Black Burst A25

Position each board over the Interconnect pins using the plastic guides for pin alignment. Seat the board firmly on the Interconnect board.

2. Install shields (A100) as follows: Between rows P54 and P55 (separating Sync Timing A20 and Subcarrier Lock A23 in the SPG2 or VIRS/Black Burst A25 in the SPG1); between rows P56 and P57 in the SPG2 (separating Subcarrier Lock A23 from VIRS/Black Burst A25); and to the right of VIRS/Black Burst A25 (separating the SPG1 or SPG2 from the other modules).

3. Install plastic pushbutton extenders on pushbutton shafts.

4. Position the front panel over the pushbutton extenders and secure to the 1410 front casting with the screws provided.

5. Connect cables to the various boards as follows:

To	From
P816 A24	P76 1410 Rear Interconnect A5 and P75 1410 Rear Interconnect A5
P846 A24	P66 1410 Rear Interconnect A5 and P65 1410 Rear Interconnect A5
P759 A24	P339 A21 and Front Output Connectors
P755 A24	Front-Panel Goniometer
P339 A21	P759 A24 and P413 1410 Subcarrier Input A13
P743 A23	P98 1410 Rear Interconnect A5
P642 A23	P415 1410 Subcarrier Input A13
P996 A25	P58 1410 Rear Interconnect A5 and Front-Panel Output Connectors
P445 A22	P98 1410 Rear Interconnect A5
P449 A22	J41 1410 Remote Connector
P161, Pin 2, A20	P170, Pin 1, A21

Reverse the installation steps to remove the module.

OPERATING MODE SELECTION

A20 Sync Timing

P103 H Drive Start	Selects either fixed H Drive Start or variable H DRIVE Start. Variable Start varies with adjustment of H Blanking Start, R116.
S109 Horiz Phasing	Provides 4 μ s delay to 10 μ s advance with respect to external sync.
P110 Horiz Blanking	Selects either fixed or variable H Blanking width. R115 and R116 adjust starting and ending time.

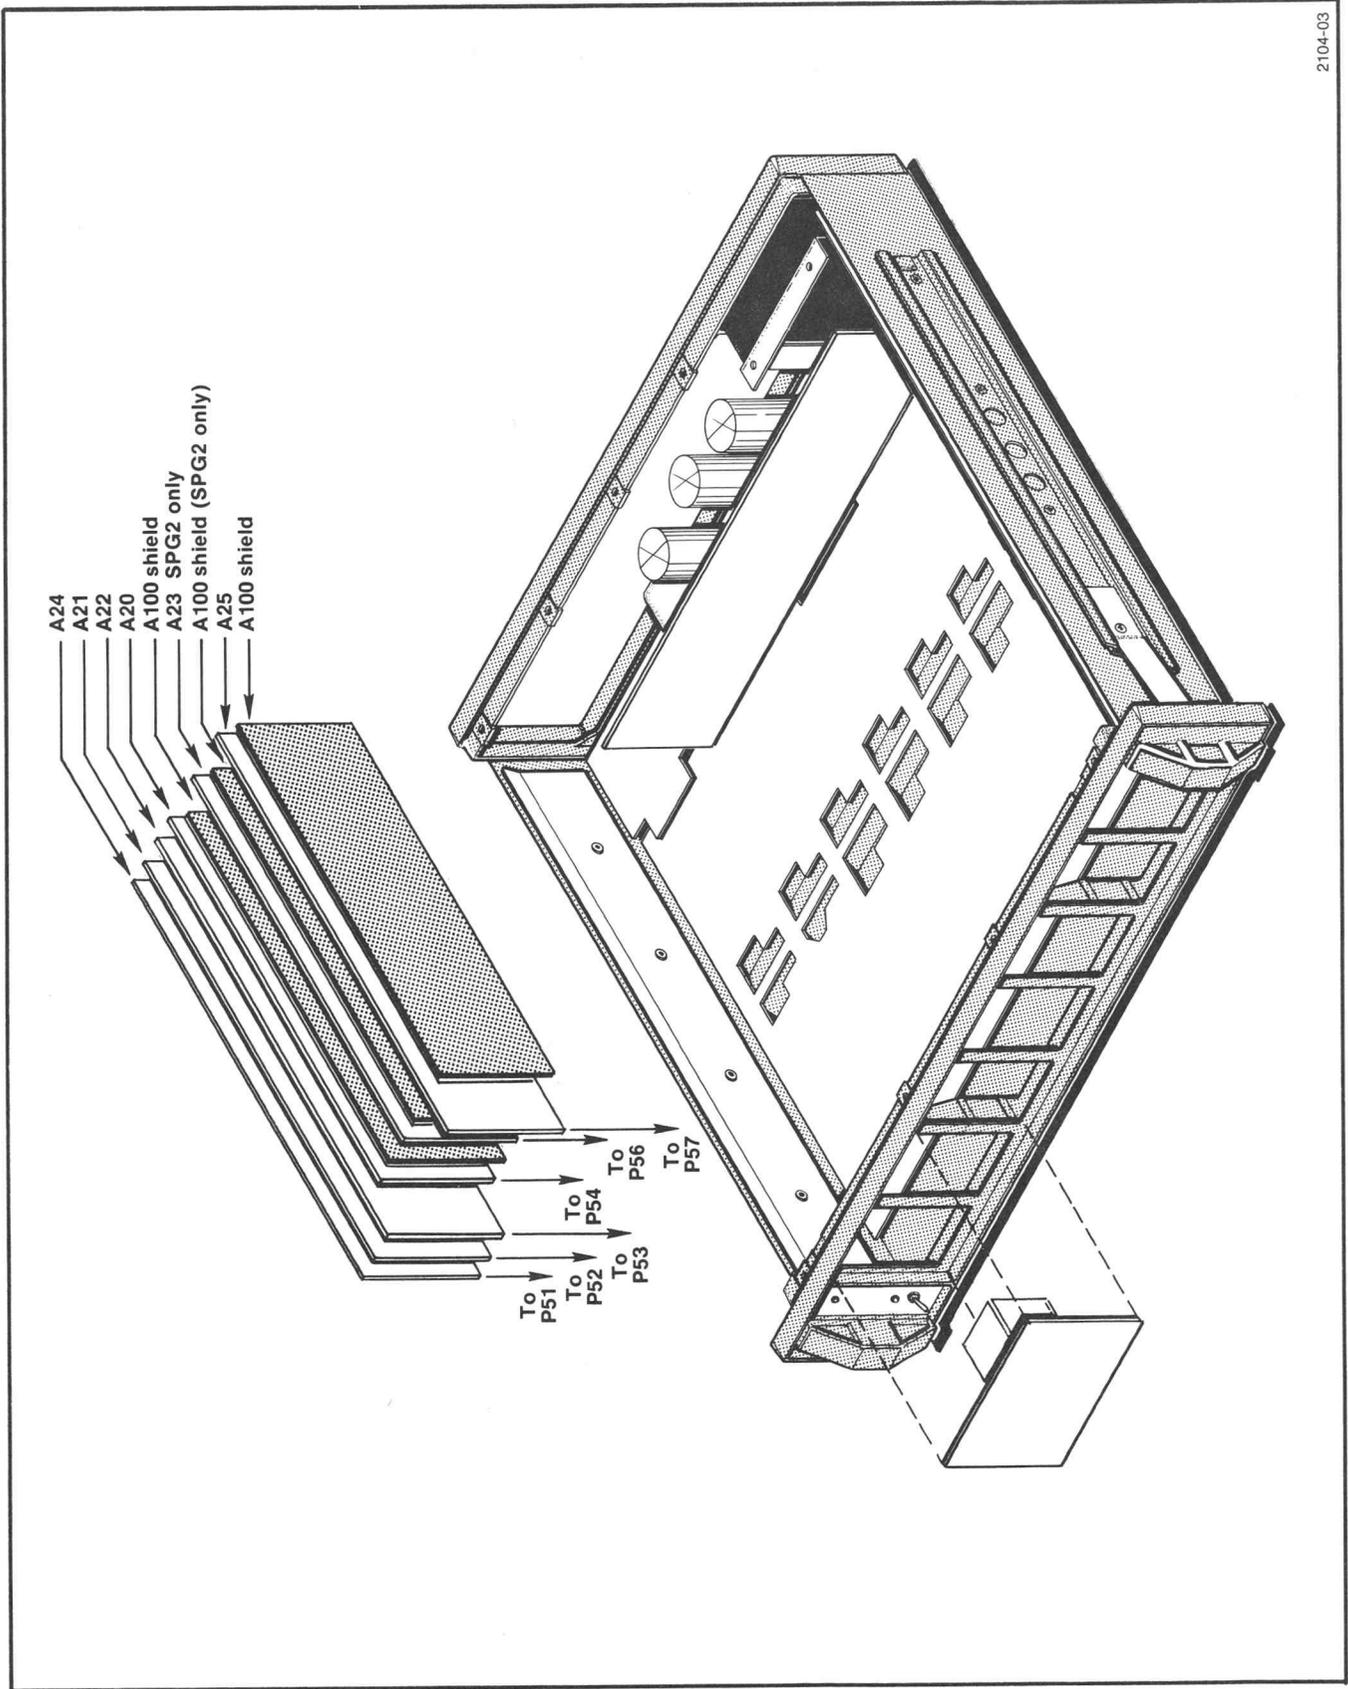

Fig. 3-1. Installation.

P111 Vert Blanking Selects either fixed or variable Vert Blanking width. Start of Vert Blanking is triggered by command from U129. End of variable Vert Blanking is controlled by R148.

P112 PAL Pulse P113 PAL Pulse Phase P112 and P113 provide functions not presently used in NTSC systems. P112 selects either a pulse occurring at sync time on alternate lines, or a square-wave that is high for one line, and low for the next. P113 selects either (a) which set of alternate lines the pulse will appear on, or (b) for which set of alternate lines the square-wave is high.

P126 V Blanking Width Selects either Short V Blanking (20 lines) or Normal blanking width (21 lines).

P129 Drive Start Selects either Blanking or Sync as the drive start for the Sync Generator.

P169 V Lock Selects either Fast lock, in which the counter in U129 is immediately reset to incoming vertical sync, or Slow lock, in which the counter is slewed at a rate of one line per field until lock occurs.

A21 Sync Lock

P228 Norm/Slow-Slow Selects speed of lock between H sync and subcarrier. Normal is a "crash" lock condition, Slow-Slow allows the counter to slew line-by-line to the correct phase.

P224 Sync/Subc Unlock; P324 Timing Jitter With a jumper installed on P224, incoming signals that do not have sync and subcarrier locked will cause a switch to sync lock. With the jumper installed on P324, switch to internal will occur under conditions of persistent noise on the incoming signal, or sync-subcarrier unlock.

P294 Osc Lock Selects either "crash" lock or slow lock of the horizontal oscillator on the SPG1 or SPG2 Sync Timing board.

A22 Generator Logic

P365 Ext Sync The Needed position requires that external sync be present to operate in the subcarrier lock mode. Not Needed does not require external sync to operate in the subcarrier lock mode.

P366, P374 SPG1/SPG2 P374 enables the Gen Lock mode of operation in SPG2's. If the Subcarrier Lock board is not installed (SPG1), this jumper must be on P366.

P382 Chrominance Disable The On position disables subcarrier portions of signals when the SPG1 or SPG2 loses either subcarrier or lock.

The Off position causes internal subcarrier to be substituted for external subcarrier on loss of subcarrier or lock.

P383 Subcarrier LED Polarity Selects mode of indication for the front-panel LED. The SUBCARRIER LED can be lit or off when subcarrier is lost.

P386 Video Disable The On position disables all video outputs upon loss of sync or lock.

The Off position substitutes internally-generated sync and subcarrier upon loss of sync or lock.

P387 Sync LED Polarity Selects mode of indication for the front-panel LED. The SYNC LED can be lit or off to indicate the loss of external sync.

P398 Ext Subcarrier The Needed position requires that external subcarrier be present to operate in the sync lock mode. Not Needed does not require external subcarrier for sync lock operation.

P399 Gen Lock Subcarrier The Needed position requires that burst be present to gen lock the SPG2. Not Needed does not require burst on the external video signal for gen lock mode.

Installation—SPG1/SPG2

A23 Subcarrier Lock

P459 Fast/Slow Lock Selects speed of subcarrier lock, either "crash" or a slower mode. Controls the subcarrier oscillator on the Subcarrier Input board in the 1410.

P685 Residual Phase Component Cancel phase cancels residual subcarrier present on the incoming signal, restoring original burst phase.

In the Ignore position, subcarrier phase is the sum of burst phase and residual subcarrier phase on the incoming signal, allowing lock to cw subcarrier.

P690 SIS Delete On deletes any sound-in-syncs (SIS) from the incoming signal after it passes through the sync stripper.

Off does not delete SIS.

A24 Pulse Output Amplifier

P836 Field Ref Timing Selects either field 3 line 10, or field 1 line 11 for generating the Field Reference pulse.

A25 VIRS/Black Burst

P855 Sync in Video Disable Mode If video is disabled under loss of lock conditions by P386 on A22, P855 selects either no output (Off) or sync output (On).

P857 VIRS Line Selects either line 18 or line 19 for the VIR Signal in Black Burst output mode.

P858 VIRS Field Selects either or both fields for the VIR Signal in Black Burst output mode.

P851 VIT Key Source Selects either internal or external sources for VIT Key.

P853 Blanking Selects either fixed and variable blanking width for the VIRS/Black Burst Signal.

RECALIBRATION PROCEDURE

Introduction

This procedure can be used to either verify that the instrument is performing to its rated specifications, or to recalibrate it after repairs or long periods of operation. A short form procedure precedes the Recalibration Procedure and can be used as a calibration record or as an index to the complete procedure.

In the complete procedure, steps or parts of steps that relate to performance check only are identified by the word "Check" in the step heading. Those steps that pertain to both the performance checks and calibration steps are headed "Check/Adjust".

Front-panel control and connector names on the SPG1 or SPG2 are capitalized, for example: SUBCARRIER PHASE. Control and connector names on test equipment or the 1410 mainframe and internal controls in the SPG1 or SPG2 have only the first letter capitalized, for example. Test Oscilloscope Time/Div, 1410 rear-panel Subcarrier input, or SPG1, SPG2 Line Frequency control.

See the circuit board illustrations in Section 8, Servicing Illustrations, of this manual for adjustment locations.

TEST EQUIPMENT

The test equipment listed here was used in preparing this procedure. The measurement capabilities described are the minimum required to recalibrate the instrument. Each piece of test equipment is assumed to be operating within its stated specifications. If alternative equipment is used, it must meet or exceed these requirements.

1. Test Oscilloscope

Dual Time Base. Range from 50 ns/Div to 5 s/Div with provisions for a delaying sweep and television triggering.

Differential Comparator. Bandwidth, dc to 30 MHz; minimum deflection factor, 1 mV/div; two channels capable of differential operation.

Dual Trace Amplifier. Vertical amplifier independent of the Differential Comparator. Bandwidth, dc to 30 MHz, minimum deflection factor, 5 mV/Div.

For example, a Tektronix 7603 with 7B53A Option 5 Dual Time Base, 7A13 Differential Comparator, and 7A18 Dual Trace Amplifier.

2. Leveled Sine Wave Generator

Capable of amplitudes from 0.2 volt peak-to-peak, frequency range from 50 kHz to 5 MHz, for example: a Tektronix SG 503 in a TM 500-series Power Unit.

3. Return Loss Bridge

Tektronix Part Number 015-0149-00.

4. 50 Ω to 75 Ω Minimum Loss Attenuator

Tektronix Part Number 011-0057-00.

5. 75 Ω Feed-Through Termination

Two, matched within 0.2% supplied as accessories with the Return Loss Bridge (item 3). Tektronix Part Numbers 011-0103-00 (red), and 011-0103-01 (green).

6. 75 Ω Feed-Through Termination (20)

Tektronix Part Number 011-0103-02.

7. 75 Ω Cable (5)

42 inches long. Tektronix Part Number 012-0074-00.

8. P6053B 10X Probe

Tektronix Part Number 010-6053-11.

9. A test signal generator module (TSG1, TSG2, TSG3, TSG4) mounted in the 1410 along with the SPG1 or SPG2. The test signal generator signal must contain a subcarrier portion at 0 APL with more than 19 cycles of subcarrier.

10. Video Signal Source

Capable of generating composite video, composite sync, and a 2 volt peak-to-peak subcarrier signal, for example: a Tektronix 1410 with SPG1 or SPG2; or a Tektronix 146.

Recalibration Procedure—SPG1/SPG2

11. Waveform Monitor

Capable of overlaying one portion of a line sweep display on another portion and having sweep magnification to at least $.1 \mu\text{s}/\text{Div}$, for example: a Tektronix 1480-series.

12. Vectorscope

Capable of measuring phase differences between two signals of less than 0.5° , for example: a Tektronix 520A.

13. Spectrum Analyzer

Capable of measuring the third harmonic of the color subcarrier to below -30 dB , for example: a Tektronix 7L12 or 7L5/L2 (7000-Series plug-in units).

14. Frequency Counter

Capable of resolving 0.25 Hz out of 3 MHz , for example: a Hewlett-Packard 5326A Option 011.

15. Calibration Fixture

For use with the Waveform Monitor. See Fig. 4-1.

Calibration Fixture

This fixture and the 1480 Waveform Monitor provide a variable calibration voltage level which can be read directly from a 10-turn dial. The schematic diagram and parts list for the fixture appear in Fig. 4-1. When S1 is in the Fixed position, the 1480 calibrator voltage is determined by the circuit in the fixture.

With P9034 connected to J9034 on the 1480, and S1 in the Fixed position, calibrate the graticule for 140 IRE (1 V). Set the Amplitude dial to 1000 and S1 to Variable. Adjust R3 (CAL), to exactly match the internal 1 V calibrator level. The dial is now calibrated so that each turn of the dial represents 100 mV.

Measurements

The signal to be measured must be fed to the 1480 CH A input, and both the OPER and CAL buttons pushed in. To check amplitude within a given tolerance, adjust the Amplitude dial while watching the waveform monitor display. When the level being measured overlays the blanking level, read the amplitude directly from the dial.

To adjust a signal level, use the Calibration Fixture as a reference. First, set the Amplitude dial to the desired level. Then, adjust the proper control so that the signal level overlays the blanking level. The signal level now matches the Amplitude level.

EQUIPMENT SETUP

1. Test Oscilloscope

(A 7603 with the 7B53A Option 5 in the right compartment, the 7A18 in the left compartment, and the 7A13 in the center compartment.)

Parts List

Ckt No.	Description	Tektronix Part No.
P9034	9-pin Amphenol #165-13	134-0049-00
R1	10kΩ ±5%, Ind. Lin. ±0.1%, 10-turn, prec. var.	311-1729-00
R2	23.7 kΩ ±1%, 1/8 W, metal film	321-0325-00
R3	2.5 kΩ ±20%, variable	311-0086-00
S1	SPDT toggle switch 10-turn dial for R1, Kilo-dial Mod. 461-S-41	260-0613-00 331-0139-00
Misc.	Approx. 3 ft. of 4-conductor cable and a small metal or plastic enclosure or case.	

Set R1 fully counterclockwise (ccw) and the dial at 0 when installing the dial.

2329-04

Fig. 4-1. Waveform Monitor Calibration Fixture.

Recalibration Procedure—SPG1/SPG2

2. 1410 with SPG1 or SPG2 and test signal module

1410

Power	On
Test Signal Module	Set for signal containing sub-carrier at 0 APL

SPG1

INTERNAL-EXTERNAL	INTERNAL
HORIZONTAL LOCK	SUBCARRIER
BLACK BURST SIG VIRS	ON

SPG2

INTERNAL-GEN LOCK/EXT	INTERNAL
GEN LOCK-EXTERNAL	EXTERNAL
HORIZONTAL LOCK	SUBCARRIER
BLACK BURST SIG VIRS	ON

When performing the Recalibration Procedure, mount each circuit board in turn on the 1410 Extender board A2. The Extender board allows easy access to the controls on the SPG1 or SPG2 board.

PROCEDURE

A20 Sync Timing Board

1. Check/Adjust Line Frequency (C159)

- a. Connect the 10X probe from the Test Oscilloscope Dual Trace Amplifier to 1410 Interface line 55.
- b. Connect the subcarrier signal from the Video Signal Source to the 1410 rear-panel Subcarrier loop-through input. Terminate the loop-through input in 75 Ω.
- c. Check—The level at Interface line 55 should be approximately +5 volts.
- d. Adjust—C159 (Line Frequency) for approximately +5 volts at Interface line 55.

2. Check Line Sync Delay Range

- a. Display composite video from the Video Signal Source and from the 1410 test signal module simultaneously on the Test Oscilloscope. Externally trigger the Test Oscilloscope with composite sync from the Video Signal Source.

Recalibration Procedure—SPG1/SPG2

b. Check—Line sync from the two sources (e.g., the Video Signal Source and the 1410 test signal module), should be approximately coincident. Select combinations of switch sections of S109 on Sync Timing Board A20 for approximate line sync coincidence if necessary.

c. Check—With all S109 switch sections closed, the 1410 test signal module line sync should lead the Video Signal Source line sync by at least 10 μ s.

d. With all S109 switch sections except section 4 open, the 1410 test signal module line sync should lag the Video Signal Source line sync by at least 4 μ s.

e. Reset S109 for approximate coincidence of the two line sync signals.

3. Check/Adjust Vertical Phasing (R169)

a. Set the Test Oscilloscope Dual Time Base Time/Div to 2 ms. Use the delaying sweep to view the vertical intervals of the two signals.

b. Check—The two displayed signals should coincide.

c. Adjust—R169 (Vertical Phasing) until the two displayed signals coincide. As R169 is adjusted, the display jumps in one-half line increments. The final setting of R169 should be between jumps.

4. Check Field Blanking Duration (Variable)

a. Place jumper P111 in the Fixed position (pins 1 and 2 connected).

b. Display the SPG1 or SPG2 COMP BLANKING output and composite video from the Video Signal Source simultaneously on the Test Oscilloscope.

c. Set the Test Oscilloscope Time/Div and Delayed Sweep Time/Div to view the vertical interval.

d. Check—The duration of the field blanking pulse should be 20 lines.

5. Check/Adjust Variable V Blanking Stop (R148)

a. Place jumper P111 in the Variable position (pins 2 and 3 connected).

b. Check—The field blanking pulses should end at the beginning of line 21 in field 1, and at the center of line 20 in field 2 (20 lines vertical blanking).

c. Adjust—R148 (Var V Blanking Stop) for the correct position of the end of field blanking. As R148 is adjusted, the display jumps in one-half line increments. The final setting of R148 should be between jumps.

d. Return P111 to the Fixed position.

6. Check Line Blanking Duration (Variable)

a. Place jumper P103 in the Fixed position (pins 2 and 3 connected); and P110 jumper in the Fixed position (pins 1 and 2 connected).

b. Display signals from the SPG1 or SPG2 front-panel COMP BLANKING connector and the 1410 rear-panel H Drive connector simultaneously on the Test Oscilloscope.

c. Set the Test Oscilloscope Time/Div to display a horizontal line.

d. Check—Fixed line blanking duration should be 10.7 μ s as measured at the 50% amplitude point on the signal.

7. Check/Adjust Variable H Blanking Start (R116) and Variable H Blanking Stop (R115)

a. Place P103 (H Drive) in the Variable position (pins 1 and 2 connected). Place P110 (H Blanking) in the Variable position (pins 2 and 3 connected).

b. Check—The leading edges of both signals should move as R116 is rotated.

c. Remove the H Drive Signal from the Test Oscilloscope and replace it with COMP SYNC from the SPG1 or SPG2.

d. Adjust—R116 so the leading edge of the line blanking starts 1.4 μ s before line sync starts.

e. Adjust—R115 for 10.7 μ s duration of line blanking.

f. Return P103 to the fixed position (pins 2 and 3 connected). Return P110 to the fixed position (pins 1 and 2 connected).

8. Check/Adjust Color Bars Horizontal Shift (R149).

a. Connect a 10X probe between the Test Oscilloscope and interface line 8 (Color Bars Timing).

b. Set the Test Oscilloscope Time/Div to view the line blanking portion of the waveform (about 2 $\mu\text{s}/\text{div}$).

c. Rotate R149 (Color Bars Horiz Shift) throughout its range. Note that at one end of the range a spike appears just following the falling edge of the waveform, and at the other end of the range the timing pulse jumps.

d. Adjust—R149 (Color Bars Horiz Shift) so that the spike is not present and the timing pulse does not jump.

9. Check/Adjust Burst Delay (R119) and Burst Width (R128).

a. Display the SPG1 or SPG2 BLACK BURST and SUBCARRIER signals simultaneously on the Test Oscilloscope.

b. Using the Test Oscilloscope delayed sweep function, view the line sync area with the main sweep at a field rate and the delayed sweep at about 2 μs .

c. Check—The time between the leading edge of line sync and the start of burst (50% point from the blanking level) should be equal to the duration of 19 cycles of subcarrier.

d. Check—Burst width should be 9 cycles of subcarrier.

e. Adjust—R119 (Burst Delay) for a time between the leading edge of line sync and the start of burst equal to the duration of 19 cycles of subcarrier.

f. Adjust—R128 (Burst Width) for 9 cycles of subcarrier burst width.

g. Check—The breezeway should be 425 ns to 525 ns in width as measured at the 10% amplitude point on sync to 50% point on burst.

h. Check—The front porch should be 1.49 μs to 1.69 μs in width as measured at the 50% amplitude points on sync and setup with respect to blanking.

10. Check Sync Timing

a. Display the SPG1 or SPG2 COMP SYNC signal on the Test Oscilloscope.

b. Using the Test Oscilloscope delayed sweep function, view the vertical interval area of the signal.

c. Check—Sync timing as follows:

Line sync duration	4.70 μs ± 100 ns	measured at 50% points
Equalizing pulse duration	2.3 μs ± 100 ns	measured at 50% points
Interval between field sync pulses	4.77 μs ± 100 ns	measured at 50% points
Field sync Pulse sequence		6 equalizing pulses— 6 sync pulses— 6 equalizing pulses

11. Check PAL Pulse

a. Connect a 10X probe between the Test Oscilloscope vertical input and Interface line 20.

b. Place P112 in the Square position (pins 1 and 2 connected).

c. Check—A square-wave should be present on Interface line 20.

d. Move P112 to the Pulse position (pins 2 and 3 connected).

e. Check—A pulse should be present on Interface line 20.

f. Display the SPG1 or SPG2 BLACK BURST signal on the Test Oscilloscope along with the PAL pulse.

g. Check—The PAL pulse should appear on different alternate pairs of video lines as P113 is moved from the 90° position (pins 2 and 3 connected) to the 270° position (pins 1 and 2 connected).

12. Check Split Field Timing

a. Display the SPG1 or SPG2 BLACK BURST signal and the signal on Interface line 27 simultaneously at a fixed rate on the Test Oscilloscope.

b. Place jumper P144 in the 1/2 Field Split position (pins 2 and 3 connected).

Recalibration Procedure—SPG1/SPG2

c. Check—The signal on Interface line 27 should be low for half the field and high for half the field.

d. Place jumper P144 in the 3/4, 1/4 Field Split position (pins 1 and 2 connected).

e. Check—The signal on Interface line 27 should be low for three-fourths of the field and high for one-fourth of the field.

f. Return jumper P144 to the 1/2 Field Split position.

13. Check V Lock

a. Set the 1410 Power switch Off.

b. Connect comp sync and subcarrier from the Video Signal Source to the proper 1410 rear-panel loop-through inputs.

c. Set the SPG1 or SPG2 INTERNAL/EXTERNAL switch to EXTERNAL.

d. Connect the SPG1 or SPG2 BLACK BURST SIG output and comp video from the Video Signal Source to the Test Oscilloscope.

e. Trigger the Test Oscilloscope externally with comp sync from the Video Signal Source.

f. Place jumper P169 in the Fast position (pins 1 and 2 connected).

g. Set the 1410 Power switch On.

h. Check—The SPG1 or SPG2 should immediately lock to the external signal.

i. Set the 1410 Power switch Off.

j. Move jumper P169 to the Slow position (pins 2 and 3 connected).

k. Set the 1410 Power switch On.

l. Check—The lock to the external signal should be slower than that in part h.

14. Check Timing Outputs

a. Check—Using the 10X probe from the Test Oscilloscope, check for proper outputs at the following Interface lines.

Interface line	Signal	Interface line	Signal
2	PAL Pulse	25	Comp Sync
3	Delayed H	26	Vert Blanking
7	H Drive	27	1/2-3/4 V
8	CB Timing	33	Field Sq. Wave
9	H Blanking	34	H*
10	Comp Blanking	35	H
11	Burst Gate	36	V/2
12	Vert Drive	37	V/4
13	Burst Gate Start	38	16H
		39	Window
		40	5 MHz
21	H/4	41	1 MHz
22	H/2	42	2H
23	H Crosshatch	43	4H
24	V Crosshatch	44	8H

NOTE

If U129 (40-pin MOS/LSI package) is replaced, check for TTL-switching spikes in the timing outputs H, H*, 2H, 4H, 8H, and 16H (use Extender board A2). If spikes are present and greater than +0.4 V on any of the outputs, add capacitors or resistors, or both, to the appropriate signal lines, at the locations designated on Diagram 1a, according to the following guidelines:

Signal	Circuit Numbers	Suggested Values and Ratings
H	U128A, C123	Use axial lead, tubular ceramic caps of 100 V, 10% ratings. Start with small values. Nominal value should be 47 pF. Maximum value should not exceed 150 pF. Mount caps on backside of board.
H*	U128B, C124	
2H	U145A, C142	
4H	U145B, C143	
8H	U145C, C144	
16H	U145D, C145	
4H	U129, R142	Use 5%, 0.25 W rated resistors. Nominal value should be 39 kΩ but can be smaller. Retain some resistance for pull-down on these outputs of the MOS device.
8H	U129, R143	
16H	U129, R124	

Retain any factory installed parts for the replaced device.

A21 Sync Lock Board

1. Check Sync Lock Loop

a. Connect comp sync and subcarrier from the Video Signal Source to the correct 1410 rear-panel loop-through inputs. If the instrument being calibrated is an SPG2, connect comp video from the Video Signal Source to the correct 1410 rear-panel loop-through input.

b. Set the SPG1 INTERNAL-EXTERNAL switch to EXTERNAL. Set the SPG2 to EXTERNAL/GEN LOCK, and set the EXTERNAL-GEN LOCK switch to GEN LOCK.

c. Set the HORIZONTAL LOCK switch to SUB-CARRIER.

d. Connect the 10X probe from the Test Oscilloscope to U284 pin 7.

e. Check—A locked indication is a dc level at U284 pin 7; unlocked is a trapezoidal wave.

2. Check/Adjust HORIZ DELAY (R175)

a. Display the SPG1 or SPG2 BLACK BURST signal and comp video from the Video Signal Source simultaneously on the Test Oscilloscope. Externally trigger the Test Oscilloscope from the Video Signal Source.

b. Check—The leading edges of the two displayed line sync pulses should coincide.

c. Adjust—HORIZ DELAY (R175) until the sync pulses leading edges coincide.

NOTE

If the HORIZ DELAY control does not match the leading edges of the two line sync pulses, set S109 on the Sync Timing board A20 to bring the SPG1, SPG2 sync pulse within the range of the HORIZ DELAY control.

d. Check—The total range of the HORIZ DELAY control should be at least 1 μ s.

3. Check Slow-Fast Lock

a. Connect a 10X probe from the Test Oscilloscope to U284 pin 1.

b. Place jumper P294 in the Fast position (pins 2 and 3 connected).

c. Press the front-panel HORIZ UNLOCK button.

d. Check—The signal at U284 pin 1 should be approximately 3 volts in amplitude.

e. Move jumper P294 to the Slow position (pins 1 and 2 connected).

f. Press the front-panel HORIZ UNLOCK button.

g. Check—The signal of U284 pin 1 should be much larger than 3 volts in amplitude.

h. Release the HORIZ UNLOCK button.

4. Check \div 455 Counter Operation

a. Connect a 10X probe from the Test Oscilloscope to TP239.

b. Check—The signal at TP239 should be a square-wave with a period equal to one horizontal line.

5. Check/Adjust Lower Phase Reset (R209), Lower Phase Advance (R198), Upper Phase Retard (R199), Upper Phase Reset (R189), and Preset Center (R276)

a. Display composite video from the Video Signal Source on the Waveform Monitor and the Test Oscilloscope. (The composite video signal must contain at least 19 cycles of subcarrier at 0 APL, and must be displayed on VITS line 18. For example: a linearity test signal with steps removed).

b. Display the Field Reference pulse from the 1410 rear panel on the Test Oscilloscope simultaneously with the composite video from the Video Signal Source.

c. Display VIRS from the SPG1 or SPG2 on the Vectorscope.

d. Externally trigger the Test Oscilloscope and externally sync the Waveform Monitor with composite sync from the Video Signal Source.

e. Externally reference the Vectorscope to the Video Signal Source subcarrier.

f. Set the Test Oscilloscope Time/Div to view four fields of composite video.

g. Set the Waveform Monitor Field switch to 1, Line Selector to Digital and line 17, and Time/Div to 10 μ s/Div.

h. Using the Waveform Monitor Waveform Comparison controls, overlay the 0 APL subcarrier on line 18 over line 18 sync and burst.

i. Set the Waveform Monitor Magnifier to .2 μ s/Div and view the sync and burst area of line 18.

j. Adjust the Waveform Monitor Waveform Comparison Overlay control until subcarrier and burst are exactly in phase.

Recalibration Procedure—SPG1/SPG2

k. Using the Waveform Monitor Position controls, set the 50% amplitude point of the leading edge of sync on a reference point somewhere along the graticule 0 IRE line.

l. Using the Waveform Monitor Vertical Position control only, set the zero crossing of the overlaid subcarrier on the graticule 0 IRE line.

m. Rotate the SPG1 or SPG2 SUBCARRIER PHASE control so that the zero crossing of a positive slope of one cycle of subcarrier falls on the same reference point used in part k of this step.

n. Set SPG1 for External mode, SPG2 for Gen Lock mode.

o. Rotate the SPG1 or SPG2 SUBCARRIER PHASE control to 0 on the dial and rotate the Vectorscope Phase control to set the VIRS vector to 180° on the Vectorscope.

p. Rotate the SPG1 or SPG2 SUBCARRIER PHASE control in the direction that causes the Vectorscope display to move clockwise until the Field Reference pulse displayed on the Test Oscilloscope shifts one television frame in time.

q. Check—The VIRS vector displayed on the Vectorscope should fall at approximately 45°.

r. Rotate the SPG1 or SPG2 SUBCARRIER PHASE control in the direction that moves the Vectorscope display counter-clockwise until the Field Reference pulse displayed on the Test Oscilloscope shifts back to the original television frame.

s. Check—The VIRS vector displayed on the Vectorscope should fall at approximately 135°.

t. Rotate the SPG1 or SPG2 SUBCARRIER PHASE control to move the VIRS vector in a counter-clockwise direction until the Field Reference pulse again shifts one television frame.

u. Check—The VIRS vector should fall at approximately 315°.

v. Rotate the SPG1 or SPG2 SUBCARRIER PHASE control to move the VIRS vector in the clockwise direction until the Field Reference pulse shifts back to its original television frame.

w. Check—The VIRS vector should fall at approximately 225°.

NOTE

If the limits above have not been met, continue through the remaining portion of Step 5.

aa. Set R198 (Lower Phase Advance) and R199 (Upper Phase Retard) so that U205 pins 7 and 4 are at the maximum voltage apart (at the stops of the controls).

ab. Center R209 (Lower Phase Reset) and R189 (Upper Phase Reset).

ac. Ground TP229 and place jumper P228 in the Normal position (pins 1 and 2 connected).

ad. Connect the 10X probe from the Test Oscilloscope to the junction of R198 and R199. Note the voltage level.

ae. Move the 10X probe to TP244.

af. Check—The voltage level at TP244 should be the same as that noted in part ad.

ag. Adjust—R276 (Preset Center) for the same voltage level as that noted in part ad.

ah. Remove the ground from TP229.

ai. Rotate the SPG1 or SPG2 SUBCARRIER PHASE control to place the VIRS vector at 45° on the Vectorscope.

aj. Adjust—R199 (Upper Phase Retard) until the Field Reference pulse displayed on the Test Oscilloscope shifts one television frame in time.

ak. Rotate the SPG1 or SPG2 SUBCARRIER PHASE control to move the VIRS vector counter-clockwise to 315°.

al. Adjust—R198 (Lower Phase Advance) until the Field Reference pulse shifts one frame.

am. Rotate the SPG1 or SPG2 SUBCARRIER PHASE control to move the VIRS vector clockwise to 225°.

an. Check—The Field Reference pulse should shift back to its original position.

6. Check/Adjust SCH ϕ Center (R219)

a. Without disturbing the equipment setup of Step 5, connect the Waveform Monitor Line Strobe Out to the Test Oscilloscope. (Use the + Input of the Differential Comparator, set the 7603 Vert Mode to Chop.)

b. Check—The Line Strobe from the Waveform Monitor and the Field Reference pulse from the 1410 should fall in the same television frame.

c. Adjust—R219 (SCH ϕ Center) until the Line Strobe from the Waveform Monitor and the Field Reference pulse from the 1410 fall in the same frame.

7. Check SCH Phasing

a. Check—The Field Ref signal from the 1410 rear panel should shift one frame in time with each 180° of rotation of the Video Signal Source Subcarrier Phase control.

8. Check/Adjust Subcarrier to Sync Lock Timing (R208)

NOTE

Make certain that the SPG1 or SPG2 SUBCARRIER PHASE control is still set to 0 on the dial, and that the equipment setup done in Step 5 is not disturbed.

a. Display the SPG1 or SPG2 BLACK BURST signal on the Test Oscilloscope. The SPG1 or SPG2 should still be in an external lock mode.

b. Externally trigger the Test Oscilloscope from the Video Signal Source.

c. Check—The display should not shift as the HORIZONTAL LOCK is switched between SUBCARRIER and SYNC.

d. Adjust—R208 (Subcarrier to Sync Lock Timing) for no display shift as HORIZONTAL LOCK is switched between SUBCARRIER and SYNC.

e. Set the SPG1 or SPG2 to INTERNAL.

f. Trigger the Test Oscilloscope internally.

g. Press the SPG1 or SPG2 front-panel HORIZ UNLOCK button.

h. Check—The subcarrier portion of the displayed signal should free run.

9. Check Normal/Slow-Slow Lock

a. Display signals from the Video Signal Source and the SPG1 or SPG2 simultaneously on the Test Oscilloscope.

b. Trigger the Test Oscilloscope externally from the Video Signal Source.

c. Set the SPG1 or SPG2 to INTERNAL.

d. Place P228 in the Normal position (pins 1 and 2 connected).

e. When the two displayed signals are one-half line apart, set the SPG1 or SPG2 to EXTERNAL.

f. Check—The SPG1 or SPG2 should immediately lock to the external source.

g. Move P228 to the Slow-Slow position (pins 2 and 3 connected).

h. Set the SPG1 or SPG2 to INTERNAL, press the HORIZ UNLOCK button wait until the two displayed signals are one-half line apart, then release the HORIZ UNLOCK button and set the SPG1 or SPG2 to EXTERNAL.

i. Check—The SPG1 or SPG2 should slowly lock to the external source.

j. Monitor the level at the emitter of Q217 (at TP217) with the 10X probe from the Test Oscilloscope.

k. Check—The level at the emitter of Q217 should go high when the displayed signal is moving to the right during Slow-Slow lock.

l. Move P228 to the Normal position.

Recalibration Procedure—SPG1/SPG2

m. Check—The level at the emitter of Q217 should be 0 volt at all times in Normal lock.

10. Check Sync/Subcarrier Unlock Switch to Sync Lock and Timing Jitter Switch to Internal

NOTE

P244 and P324 route different commands to the Generator Logic board A22 depending on which pair of the two pairs of pins are connected together. A jumper is installed on P324 at the factory, leaving P224 open. When P224 is to be used, remove the jumper from P324 and place it on P224.

- a. Place the jumper on P324.
- b. Press the SPG1 or SPG2 front-panel HORIZ UNLOCK button.
- c. Check—The HORIZONTAL LOCK LED should be lit.
- d. Move the jumper to P224.
- e. Press the HORIZ UNLOCK button.
- f. Check—The HORIZONTAL LOCK LED should not be lit.
- g. Return the jumper to P324.

A22 Generator Logic Board

1. Check INTERNAL Mode Operation

- a. Connect composite sync, subcarrier, and composite video from the Video Signal Source to the appropriate 1410 rear-panel loop-through connectors.
- b. Set the SPG1 or SPG2 for INTERNAL operation.
- c. Display the SPG1 or SPG2 BLACK BURST signal and a signal from the Video Signal Source simultaneously on the Test Oscilloscope. Trigger the Test Oscilloscope externally from the Video Signal Source.

d. Place P383 and P387 jumpers for the desired SYNC and SUBCARRIER LED indication. (P387 SYNC, pins 1 and 2 connected, lit when external sync is absent; pins 2 and 3 connected, lit when external sync is present. P383 SUBCARRIER, pins 1 and 2 connected, lit when external subcarrier is absent, pins 2 and 3 connected, lit when external subcarrier is present.)

e. Check—The front-panel INTERNAL LED should be lit and the two signals displayed on the Test Oscilloscope should not be locked.

2. Check SYNC Lock EXTERNAL Mode Operation

- a. Set the SPG1 or SPG2 for EXTERNAL operation. Set HORIZONTAL LOCK to SYNC.
- b. Place P386 jumper in the "Can" position (pins 2 and 1 connected). Place P855 in "on" position (pins 1 and 2).
- c. Check—The SYNC and SUBCARRIER LED's indicate the presence of external sync and subcarrier.
- d. Check—The two signals displayed on the Test Oscilloscope should be locked.
- e. Remove composite sync from the 1410 rear-panel loop-through connector.
- f. Check—The SYNC LED should change states, the INTERNAL LED should be lit, and BLACK BURST displayed on the Test Oscilloscope will go to zero.
- g. Connect composite sync to the appropriate 1410 rear-panel loop-through connector.
- h. Re-position all jumpers.
- i. Remove subcarrier from the 1410 rear-panel loop-through connector.
- j. Check—The SUBCARRIER LED should change states, and the two signals displayed on the Test Oscilloscope should remain sync-locked, but subcarrier will go to zero.
- k. Move P398 jumper to the Ext Subc Needed position (pins 2 and 3 connected).

l. Check—The SUBCARRIER LED should continue to indicate absence of external subcarrier, the INTERNAL LED should be lit, and the two signals displayed on the Test Oscilloscope should not be locked.

m. Re-position P398.

3. Check SUBCARRIER Lock EXTERNAL Mode Operation

a. Set the SPG1 or SPG2 HORIZONTAL LOCK to SUBCARRIER.

b. Check—The SUBCARRIER LED should indicate the absence of external subcarrier, the INTERNAL LED should be lit, and the two signals displayed on the Test Oscilloscope should not be locked.

c. Move P398 jumper to the Ext Subc Not Needed position (pins 1 and 2 connected).

d. Check—The SYNC and SUBCARRIER LED's should not change, the SYNC LOCK LED should be on, and the two signals displayed on the Test Oscilloscope should be sync-locked.

e. Remove composite sync from the 1410 rear-panel loop-through connector. Connect subcarrier to the 1410 rear-panel Subcarrier loop-through connector.

f. Check—The SYNC and SUBCARRIER LED's should change states, the SYNC LOCK LED should be off, and the two signals displayed on the Test Oscilloscope should be locked.

g. Move P365 to the Ext Sync Needed position (pins 1 and 2 connected).

h. Check—The SYNC and SUBCARRIER LED's should not change, the INTERNAL LED should be on, and the two signals displayed on the Test Oscilloscope should not be locked.

i. Re-position P365 to pins 2 and 3.

4. Check LED Polarity and Chroma and Video Disable

a. Connect composite sync to the 1410 rear-panel Sync loop-through connector.

b. Check—The SYNC and SUBCARRIER LED's should not be lit.

c. Remove external sync and subcarrier from the 1410 rear-panel loop-through connectors.

d. Check—The SYNC and SUBCARRIER LED's should be lit.

e. Move P383 and P387 jumpers to the Sync Present and Subc Present positions (pins 2 and 3 connected).

f. Check—The SYNC and SUBCARRIER LED's should not be lit.

g. Connect external sync and subcarrier to the appropriate 1410 rear-panel loop-through connectors.

h. Check—The SYNC and SUBCARRIER LED's should be lit.

i. Re-position P383 and P387 to pins 1 and 2.

j. Connect the 10X probe from the Test Oscilloscope to Interface line 31.

k. Check—Interface line 31 should be low under all conditions.

l. Move P382 to the Can position (pins 1 and 2 connected).

m. Remove external sync and subcarrier from the 1410 rear-panel loop-through connectors.

Recalibration Procedure—SPG1/SPG2

- n. Check—Interface line 31 should be high.
- o. Place P386 in the Can position (pins 1 and 2 connected).
- p. Move the 10X probe to Interface line 32.
- q. Check—Interface line 32 should be high.
- r. Connect external sync and subcarrier to the appropriate 1410 rear-panel loop-through connectors.
- s. Move P386 to the Can't position (pins 2 and 3 connected).
- t. Check—Interface line 32 should be low under all conditions.

5. Check GEN LOCK Mode (SPG2 Only)

- a. Set the SPG2 for GEN LOCK operation.
- b. Remove composite sync from the Video Signal Source composite video signal.
- c. Check—The SYNC and SUBCARRIER LED's should change states and the INTERNAL LED should be lit.
- d. Restore composite sync to the Video Signal Source composite video signal. Move P399 to "Needed" position (pins 2 and 3).
- e. Remove burst from the Video Signal Source composite video signal.
- f. Check—The SUBCARRIER LED should change states and the INTERNAL LED should be lit.
- g. Move P399 to the Not Needed position (pins 1 and 2 connected).
- h. Check—The INTERNAL LED is not lit.
- i. Restore burst to the Video Signal Source composite video signal.

A23 Subcarrier Lock Board (SPG2 Only)

1. Check/Adjust Sync Stripper (R707, R749)

- a. Connect composite video from the Video Signal Source to the 1410 rear-panel Gen Lock loop-through input connector.
- b. Terminate the loop-through connector into 75 ohms.
- c. Set the SPG2 for GEN LOCK mode of operation.
- d. Connect the 10X probe from the Test Oscilloscope to Interface line 53.
- e. Check—The sync pulse present on Interface line 53 should have no step at the trailing edge.
- f. Set R707 (SIS Lockout) so that the voltage at R707 wiper arm is maximum positive (+14.6 V to +15 V).
- g. Adjust—Preset R749 (noise Lockout) to maximum positive voltage (+7 V or higher) at R749 wiper arm. Then, readjust R749 to just eliminate the step at the sync pulse trailing edge.

2. Check AGC

- a. Connect the 10X probe from the Test Oscilloscope to TP714.
- b. Check—The signal amplitude at TP714 should remain constant as the input signal amplitude is varied from one-half to two times nominal (1 volt).

NOTE

Three 75 Ω terminations in series with the input signal reduces the amplitude to one-half. An unterminated input signal is two times nominal (1 volt).

- c. Check—The SUBCARRIER LED should not be lit within the AGC range.

3. Check/Adjust Subcarrier Phase (L679)

- a. Connect the 10X probe from the Test Oscilloscope to TP668.
- b. Adjust—L679 (Subcarrier Phase) for maximum dc level at TP668.

c. Connect the SPG2 BLACK BURST signal on the Vectorscope.

d. Lock the Vectorscope to the Video Signal Source subcarrier.

e. Check—The burst phase displayed on the Vectorscope should not vary more than $\pm 3^\circ$ as the input signal amplitude is varied from one-half to two times nominal.

4. Check Phase Stability with Dynamic APL

a. Apply a composite video signal that is variable in Average Picture Level from the Video Signal Source to the 1410 rear-panel Gen Lock loop-through input.

b. Check—The phase of the signal displayed on the Vectorscope should change by 0.1° or less as the input APL is varied from 10% to 90%.

5. Check Phase Response to Residual Subcarrier

a. Display the Video Signal Source subcarrier and composite video signal simultaneously on the Vectorscope.

b. Lock the Vectorscope to the Video Signal Source subcarrier.

c. Rotate the Video Signal Source Subcarrier Phase control to set the burst phase 90° from the subcarrier phase. Do not move the Video Signal Source subcarrier Phase control for the remainder of this step.

d. Remove the Video Signal Source composite video and subcarrier from the Vectorscope signal inputs. Leave the Vectorscope locked to the Video Signal Source subcarrier.

e. Display the SPG2 SUBCARRIER and BLACK BURST signals simultaneously on the Vectorscope.

f. Rotate the SPG2 SUBCARRIER PHASE control to set the BLACK BURST phase 90° from the SUBCARRIER phase.

g. Remove the $75\ \Omega$ termination from the 1410 rear-panel Gen Lock loop-through connector.

h. Connect subcarrier from the Video Signal Source through the $10X\ 75\ \Omega$ attenuator to the 1410 rear-panel Gen Lock loop-through connector. Composite video Signal Source should still be connected to the other side of the Gen Lock connector.

i. Set P685 to the Ignore position (pins 2 and 3 connected).

j. Check—The phase of the BLACK BURST signal displayed on the Vectorscope should change 15° or more when the subcarrier signal is removed from the 1410 rear-panel Gen Lock loop-through connector.

k. Reconnect Video Signal Source subcarrier through the $10X\ 75\ \Omega$ attenuator to the 1410 rear-panel Gen Lock loop-through connector.

l. Move P685 jumper to the Cancel position (pins 1 and 2 connected).

m. Check—The phase of the BLACK BURST signal displayed on the Vectorscope should change 10° or less when the subcarrier signal is removed from the 1410 rear-panel Gen Lock loop-through connector.

n. Terminate the 1410 rear-panel Gen Lock loop-through connector in $75\ \Omega$.

6. Check SUBCARRIER PHASE Range

a. Rotate the SPG2 SUBCARRIER PHASE control.

b. Check—The phase of the signal displayed on the Vectorscope should change 360° for each 360° rotation of the SUBCARRIER PHASE control.

7. Check Fast/Slow Lock

a. Connect the $10X$ probe from the Test Oscilloscope to TP456.

b. Move P459 jumper to the Slow position (pins 2 and 3 connected).

c. Check—The dc voltage at TP456 should move only slightly as the Video Signal Source burst is turned off and then restored.

Recalibration Procedure—SPG1/SPG2

d. Place P459 jumper in the Fast position (pins 1 and 2 connected).

e. Check—The dc voltage at TP456 should near 0 volt briefly as the Video Signal Source burst is turned off and then restored.

8. Check Horizontal Jitter

a. Display the SPG2 BLACK BURST signal on the Test Oscilloscope.

b. Externally trigger the Test Oscilloscope with composite sync from the Video Signal Source.

c. Using the Test Oscilloscope delayed sweep function and magnifier, view the leading edge of a line sync pulse at 20 ns/div (.2 μ s/div X10 mag).

d. Check—With the SPG2 HORIZONTAL LOCK in SYNC, jitter on the sync pulse leading edge should be 10 ns or less. With HORIZONTAL LOCK in SUBCARRIER, jitter should not exceed 4 ns.

9. Check/Adjust Oscillator Frequency (R456)

a. Remove the composite video signal from the 1410 rear-panel Gen Lock loop-through connector.

b. Connect the SPG2 SUBCARRIER output to the Frequency Counter.

c. Check—Subcarrier frequency should be within 10 Hz of 3.579545 MHz if the SPG2 is installed in a 1410, or within 1 Hz of 3.579545 MHz if the SPG2 is installed in a 1410 Option 1.

d. Adjust—R456 (Oscillator Frequency) for 3.579545 MHz.

A24 Pulse Output Amplifier Board

1. Check/Adjust Subcarrier Amplitude (C779, 1410 C496)

a. Connect one of the 1410 rear-panel Subcarrier outputs through 75 Ω termination to the Test Oscilloscope.

b. Check—The Subcarrier signal should be 1.8 volts peak-to-peak to 2.2 volts peak-to-peak in amplitude.

c. Adjust—C779 (Subcarrier Amplitude) for 2.0 volts peak-to-peak Subcarrier signal amplitude.

d. Check—The other 1410 rear-panel Subcarrier output should be identical to the first.

e. Connect the SPG1 or SPG2 SUBCARRIER output through 75 Ω termination to the Test Oscilloscope input.

NOTE

The SPG1 or SPG2 SUBCARRIER output is driven directly from the Subcarrier Output Amplifier on the 1410 Subcarrier Input board, A13. This output is provided as a subcarrier phase reference. The subcarrier signal phase at the SPG1 or SPG2 front panel cannot be varied with the SUBCARRIER PHASE control, but is always the same as the reference subcarrier (either from the 1410 Subcarrier Oscillator or from an external source). The Subcarrier Amplitude control on the 1410 Subcarrier Input board, A13 (C496), must be adjusted to set the amplitude of the SUBCARRIER output signal. See the 1410 manual for adjustment location.

f. Check—The SUBCARRIER signal should be 1.8 volts peak-to-peak to 2.2 volts peak-to-peak.

g. Adjust—C496 (Subcarrier Amplitude) on the 1410 Subcarrier Input board, A13, for 2.0 volts peak-to-peak SUBCARRIER signal amplitude.

2. Check/Adjust Comp Blanking Compensation (C798, C808, C809)

a. Connect the SPG1 or SPG2 COMP BLANKING output through 75 Ω termination to the Test Oscilloscope input.

b. Check—The signal amplitude should be 3.8 volts to 4.2 volts.

c. Check—Rise and fall time should be 120 ns to 160 ns.

d. Adjust—C798 (Rate) for 120 ns to 160 ns rise and fall times.

e. Repeat this step for each of the two 1410 rear-panel Comp Blanking outputs. Adjust C808 for the signal at J12 and C809 for the signal at J13.

3. Check/Adjust Comp Sync Compensation (C799, C838, C839)

- a. Connect the SPG1 or SPG2 COMP SYNC output through 75 Ω termination to the Test Oscilloscope input.
- b. Check—The signal amplitude should be 3.8 volts to 4.2 volts.
- c. Check—Rise and fall times should be 120 ns to 160 ns.
- d. Adjust—C799 (Rate) for 120 ns to 160 ns rise and fall times.
- e. Repeat this step for each of the two 1410 rear-panel Comp Sync outputs. Adjust C838 for the signal at J10 and C839 for the signal at J11.

4. Check/Adjust Burst Flag Compensation (C818), Burst Flag Delay (R800), and Burst Flag Width (R820)

- a. Connect the 1410 rear-panel Burst Flag output through 75 Ω termination to the Test Oscilloscope input.
- b. Check—The signal amplitude should be 3.8 volts to 4.2 volts.
- c. Check—Rise and fall times should be 120 ns to 160 ns.
- d. Adjust—C818 (Rate) for 120 ns to 160 ns rise and fall times.
- e. Externally trigger the Test Oscilloscope with the SPG1 or SPG2 COMP SYNC signal.
- f. Connect one of the 1410 rear-panel Comp Sync outputs through 75 Ω termination to the Test Oscilloscope so that comp sync and burst flag are displayed simultaneously.
- g. Note the position of the leading edge of line sync.
- h. Check—The leading edge of the Burst Flag pulse should be 5.3 μ s \pm 35 ns from the leading edge of line sync.
- i. Adjust—R800 (Burst Flag Delay) so that the leading edge of the Burst Flag pulse is 5.265 μ s to 5.335 ns from the leading edge of line sync.

- j. Check—The half-amplitude width of the Burst Flag pulse should be 2.5 μ s \pm 70 ns.

- k. Adjust—R820 (Burst Flag Width) for 2.43 μ s to 2.57 μ s half-amplitude width of the Burst Flag pulse.

5. Check/Adjust H Drive Compensation (C819, C848)

- a. Connect 1410 rear-panel H Drive output J16 through 75 Ω termination to the Test Oscilloscope input.
- b. Check—The signal amplitude should be 3.8 volts to 4.2 volts.
- c. Check—Rise and fall times should be 120 ns to 160 ns.
- d. Adjust—C819 (Rate) for 120 ns to 160 ns rise and fall times.
- e. Repeat this step for H Drive output J15 on the 1410 rear panel. (Adjust C848 for correct 120 ns to 160 ns rise and fall times.)

6. Check/Adjust V Drive Compensation (C828, C849)

- a. Connect 1410 rear-panel V Drive output J18 through 75 Ω termination to the Test Oscilloscope input.
- b. Check—The signal amplitude should be 3.8 volts to 4.2 volts.
- c. Check—Rise and fall times should be 120 ns to 160 ns.
- d. Adjust—C828 (Rate) for 120 ns to 160 ns rise and fall times.
- e. Repeat this step for V Drive output J19 on the 1410 rear panel. (Adjust C849 for 120 ns to 160 ns rise and fall times.)

7. Check/Adjust Field Reference Compensation (C829)

- a. Connect the 1410 rear-panel Field Ref output J14 through 75 Ω termination to the Test Oscilloscope input.
- b. Connect the SPG1 or SPG2 BLACK BURST signal through 75 Ω termination to the other Test Oscilloscope input.

Recalibration Procedure—SPG1/SPG2

c. Externally trigger the Test Oscilloscope with V Drive from the 1410 rear panel.

d. Check—The Field Ref signal amplitude should be 3.8 volts to 4.2 volts.

e. Check—Rise and fall times should be 120 ns to 160 ns.

f. Adjust—C829 (Rate) for 120 ns to 160 ns rise and fall times.

g. Place P836 in the Field 1, line 11 position.

h. Check—The Field Ref pulse should be at line 11 of Field 1.

i. Move P836 to the Field 3, line 10 position.

j. Check—The Field Ref pulse should be at line 10 of Field 3.

8. Check Return Loss

a. Remove all connections from the SPG1 or SPG2, the 1410, and the Test Oscilloscope.

b. Set the SPG1 or SPG2 for INTERNAL operation.

c. Trigger the Test Oscilloscope internally.

d. Connect the Return Loss Bridge to the Test Oscilloscope Differential Comparator.

e. Connect the Leveled Sine Wave Generator through 50 Ω cable and the 50 Ω to 75 Ω Minimum Loss Attenuator to the Return Loss Bridge input.

f. Set the Leveled Sine Wave Generator Frequency Range to Ref \approx .05 (50 kHz), and the Test Oscilloscope Volts/Div to .1 V. Set the Differential Comparator for differential operation.

g. Remove the 75 Ω termination from the Return Loss Bridge Unknown arm and adjust the Leveled Sine Wave Generator Output Amplitude control for 500 mV display amplitude.

h. Replace the 75 Ω termination on the Return Loss Bridge Unknown arm.

i. Set the Test Oscilloscope Volts/Div to 10 mV.

j. Adjust the Return Loss Bridge Balance control for minimum display amplitude.

k. Remove the 75 Ω termination from the Return Loss Bridge unknown arm.

l. Check return loss of all outputs on the SPG1 or SPG2 front panel and the 1410 rear panel by connecting the unterminated Unknown arm to each connector and checking the Test Oscilloscope display amplitude for 16 mV or less.

NOTE

When checking SPG1 or SPG2 SUBCARRIER return loss, remove Q464 on the 1410 Subcarrier Input board, A13. When checking the return loss of the Subcarrier outputs on the 1410 rear panel, remove Q767 on the SPG1 or SPG2 Pulse Output Amplifier board, A24.

m. Check return loss of the loop-through inputs on the 1410 rear panel by connecting the Unknown arm to one side of the of the loop-through connector and the 75 Ω termination to the other side. Check for 3 mV display amplitude.

n. Remove the Return Loss Bridge.

9. Check Isolation

a. Check all double and triple outputs for active and passive isolation in the following manner:

Passive Isolation. Connect the output of interest through 75 Ω termination to the Test Oscilloscope input. Observe the signal amplitude at that output while shorting another output of the same signal to ground. The observed signal amplitude should change by no more than 1%.

Active Isolation. Observe the output of interest on the Test Oscilloscope while introducing a subcarrier signal into another output of the same signal. The subcarrier signal should be attenuated at the observed output by at least 30 dB. The introduced subcarrier signal amplitude should be varied from 0.5 volt to 4.0 volts.

A25 VIRS/Black Burst Board**NOTE**

The adjustments in this step affect the harmonic content of the output signal. Only slight adjustment from the original calibration should be attempted without using a spectrum analyzer.

1. Check/Adjust Full Field Reference Signal Amplitude (R978)

a. Connect the SPG1 or SPG2 BLACK BURST signal output to the 1480 CH A input and terminate in 75 Ω . Set the Full Field Reference switch S838 to the on position.

b. Set the 1480 Display to 10 μ s/div, Volts Full Scale to 0.5, and push in the Cal and Oper switches.

c. Check—Using the Amplitude dial for the Calibration Fixture to match the sync with blanking, read 286 mV \pm 3.6 mV.

d. Adjust—R978 (Gain) for 286 mV of sync amplitude.

2. Check/Adjust DC Level (R969)

a. Set the 1480 Volts Full Scale to 1.0, Display to 10 μ s/div, push in the Oper switch, and set the DC Restorer Off and the Response switch to Aux Video In. Position the trace to the 0 IRE graticule line and move the BLACK BURST signal output cable to the 1480 Aux Video In connector.

b. Check—The waveform blanking level should be 0 V \pm 50 mV (\pm 7 IRE).

c. Adjust—R969 (DC Level) for a 0 volt blanking level. Recheck Step 1 signal amplitude after making this adjustment. Return the BLACK BURST signal output cable to the 1480 CH A input connector.

3. Check VIRS Luminance Levels

a. Remove Q944 to disable VIRS chrominance.

b. Check—Use the Calibration Fixture to read the following:

Setup Level—53.57 mV \pm 3.57 mV
Gray Level—357 mV \pm 3.57 mV
Chrominance Pedestal—500 mV \pm 5 mV

4. Check/Adjust VIRS Luminance Risetime (L981, L984)

a. Set the 1480 to measure risetime—Mag at .1 μ s/div.

b. Check—Luminance risetime should be 260 ns \pm 37.5 ns.

c. Adjust—L981 and L984 (Virs Lum Shape) for correct risetime and minimum aberrations. Graticule A of the 1480 Waveform Monitor has built-in rise and fall time measurement capability. Point R at 80 IRE Units aligns with T on the 0 IRE Unit reference line.

To measure rise or fall time, set the transition amplitude to 100 IRE Units (use the VARIABLE Volts Full Scale). Vertically position the display so that the transition is from the -10 IRE Unit line to the +90 IRE Unit line. Use the 100 ns/div time base and horizontally position the rise (or fall) of the transition through point R on the short 2 IRE Unit/div scale. Measure the distance from point T on the 0 IRE Unit reference line to where the transition crosses the reference line.

5. Check/Adjust Sync Risetime (L971, L974)

a. Check—Sync risetime should be 130 ns \pm 20 ns -10 ns.

b. Adjust—L971 and L974 (Sync Shape) for correct risetime and minimum aberrations.

c. Replace Q944.

6. Check/Adjust Burst Risetime (L911)**NOTE**

Adjustments in Steps 6, 7, and 8 should not be performed unless absolutely necessary.

a. Push in the HORIZ UNLOCK pushbutton on the SPG front panel.

b. Check—Burst risetime should be 400 ns \pm 60 ns.

c. Place the Test Oscilloscope 10X probe on TP911.

d. Check—For square burst gate corners and minimum aberrations.

e. Adjust—L911 (Burst Gate Shape) for square burst gate corners and minimum aberrations.

Recalibration Procedure—SPG1/SPG2

7. Check/Adjust VIRS Chrominance Risetime (L923, L933)

a. Push in the HORIZ UNLOCK pushbutton on the SPG front panel.

b. Check—Chrominance risetime should be $1\ \mu\text{s} \pm 150\ \text{ns}$.

c. Place the Test Oscilloscope 10X probe on TP924.

d. Check—For best shape and minimum aberrations.

e. Adjust—L923 and L933 (Chrom. Timing Shape) for best shape and minimum aberrations.

8. Adjust Chrominance Bandpass Filter (L938, L948)

NOTE

The adjustments in this step affect the harmonic content of the output signal. Only slight adjustment from the original calibration should be attempted without using a spectrum analyzer.

a. Connect the BLACK BURST signal output to the Spectrum Analyzer and display the chrominance signal.

b. Adjust—L938 and L948 (Chrominance Bandpass Filter) for best compromise between Step 8b and third order harmonics of $-30\ \text{dB}$ or more.

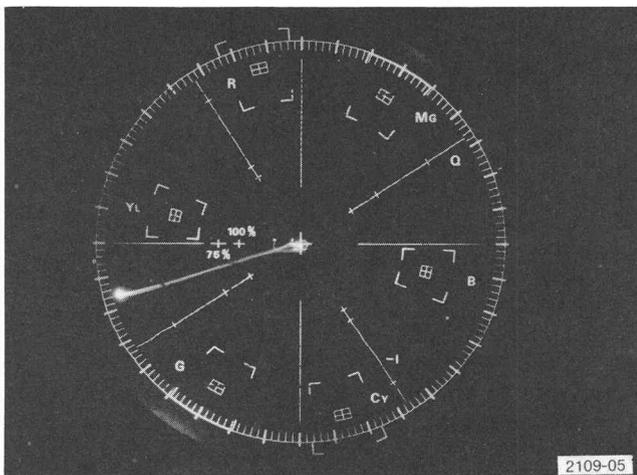

Fig. 4-2. Chrominance Bandpass Filter adjusted for best vector overlay.

9. Check/Adjust Residual Subcarrier (C928, R904)

a. Set the 1480 VFS to 0.2 and position the blanking level at the 0 IRE graticule line.

b. Check—Residual subcarrier should be 2.5 mV or less.

c. Adjust—C928 and R904 (Residual Subcarrier) for 2.5 mV or less residual subcarrier.

10. Check/Adjust Chrominance Amplitude (R958)

a. Set the 1480 to Cal mode. Use the Calibration Fixture Amplitude control to position the top and bottom of chrominance packet to the blanking level. Subtract the two readings to obtain the actual amplitude.

b. Check—Chrominance amplitude should be $285.7\ \text{mV} \pm 2.86\ \text{mV}$ and the bottom of the chrominance packet should be even with the gray level.

c. Adjust—R958 (Chrominance Gain) for $285.7\ \text{mV} \pm 2.86\ \text{mV}$.

NOTE

Adjustments performed in Steps 7 through 10 interact. Repeat if necessary.

11. Check Black Burst Setup Level

a. Push in the Full Field Ref pushbutton and display the BLACK BURST signal on the 1480.

b. Check—Setup level should be $53.57\ \text{mV} \pm 3.57\ \text{mV}$.

12. Check Black Burst Timing

a. Check—Refer to Fig. 4-3 for timing details.

13. Check/Adjust Subcarrier Phase (C865, L863)

a. Connect the 1410 Mainframe Subcarrier output to the vectorscope CW Ext ϕ Ref input. Connect the other Ext ϕ Ref input to CH B through the 10X attenuator pad. Connect the SPG1 or SPG2 BLACK BURST signal output to CH A. Display CH A and CH B. See Fig. 4-4.

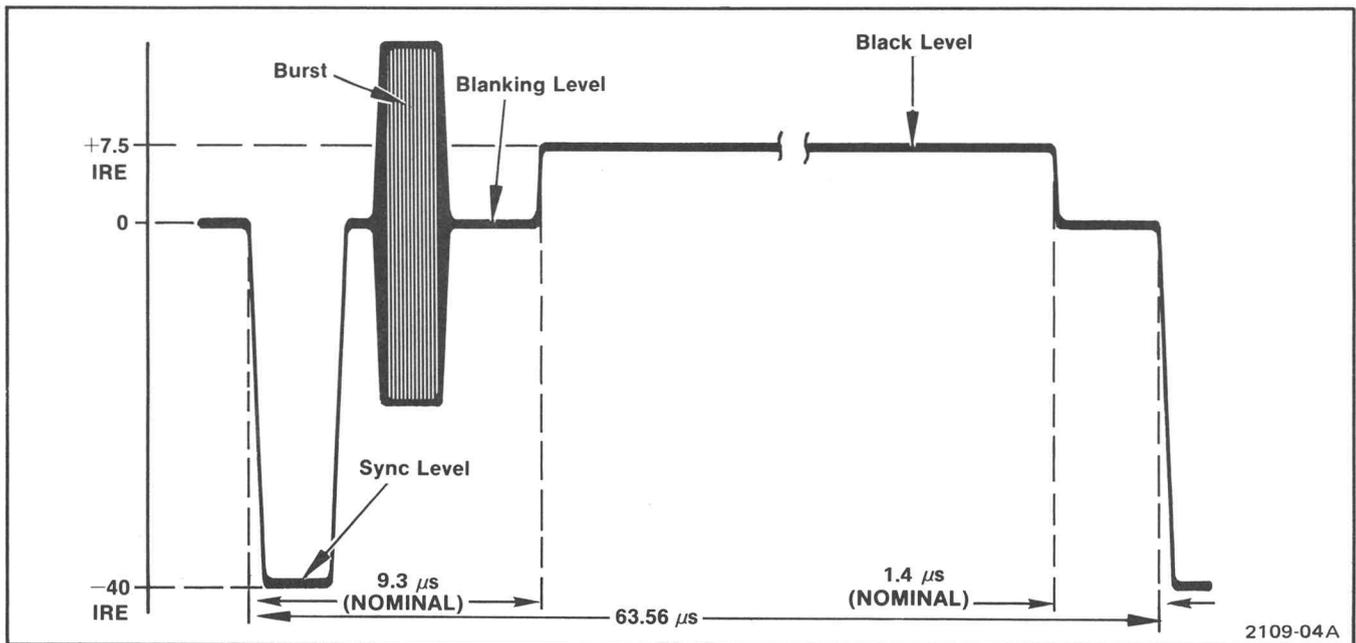

Fig. 4-3. The Black Burst Signal.

b. Check—VIRS subcarrier phase is within 0.5° of the SPG1 or SPG2 burst phase.

c. Adjust—C865 and L863 (Subcarrier Phase) to match SPG1 or SPG2 burst phase with the 1410 subcarrier phase.

14. Check VIRS Line and Field Timing

- a. Push in the VIRS pushbutton and set the 1480 for dig line selection.
- b. Check—P858 selects proper fields: 1, 2, or both.
- c. Check—P857 selects Line 18 or Line 19.

15. Check VIRS Timing

- a. Display the FULL FIELD REF signal on the 1480.
- b. Check—Refer to Fig. 4-5 for timing details.

16. Check Isolation

- a. Note the VIRS amplitude on the 1480 display and short the opposite output pins together.
- b. Check—Change in output should not exceed 1%.
- c. Reverse connections in step a and repeat step b.
- d. Connect the Test Oscilloscope to one pair of output connectors through a 75Ω in-line terminator.

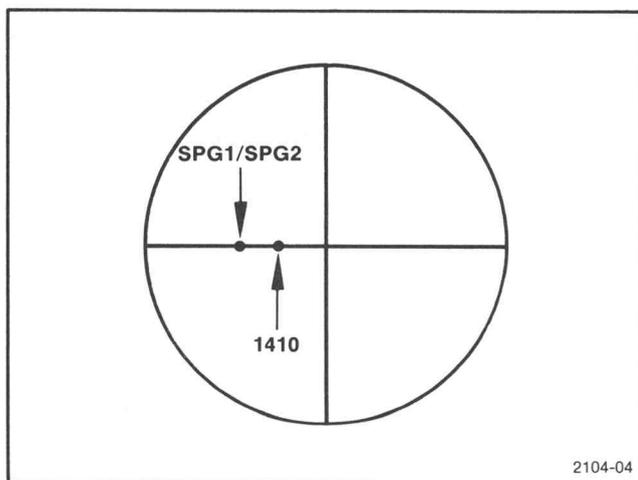

Fig. 4-4. Subcarrier phase adjustment illustration.

Recalibration Procedure—SPG1/SPG2

e. Connect the Sine-wave Generator to the other pair of output connectors through a 75 Ω in-line terminator. Set the Sine-wave Generator frequency to 3.58 MHz.

f. Check—The observed output should be -40 dB as the generator amplitude is varied from 0.5 V to 4 V (5 mV to 40 mV). Reverse output connections and repeat check.

17. Check Return Loss

a. Connect the Return Loss Bridge to the Test Oscilloscope Differential Comparator. Set the Differential Comparator for differential measurements.

b. Connect the Sine-wave Generator output through a "T" connector to the Return Loss Bridge input (see the Return Loss Bridge instruction manual) and to the Test Oscilloscope Vertical Amplifier plug-in.

c. Set the Test Oscilloscope for alternate channel viewing.

d. Set the Sine-wave Generator frequency controls for 5 MHz output.

e. Remove the 75 Ω terminator from the Return Loss Bridge Unknown arm.

f. Set the Sine-wave Generator Amplitude control for 500 mV output as monitored on the Test Oscilloscope.

g. Connect the Return Loss Bridge Unknown arm to the SPG1 or SPG2 VIRS output connector.

h. Check—Amplitude should not exceed 16 mV (30 dB return loss) as frequency is varied from 50 kHz to 5 MHz. Maintain constant sine-wave amplitude as monitored on the Test Oscilloscope Vertical Amplifier channel.

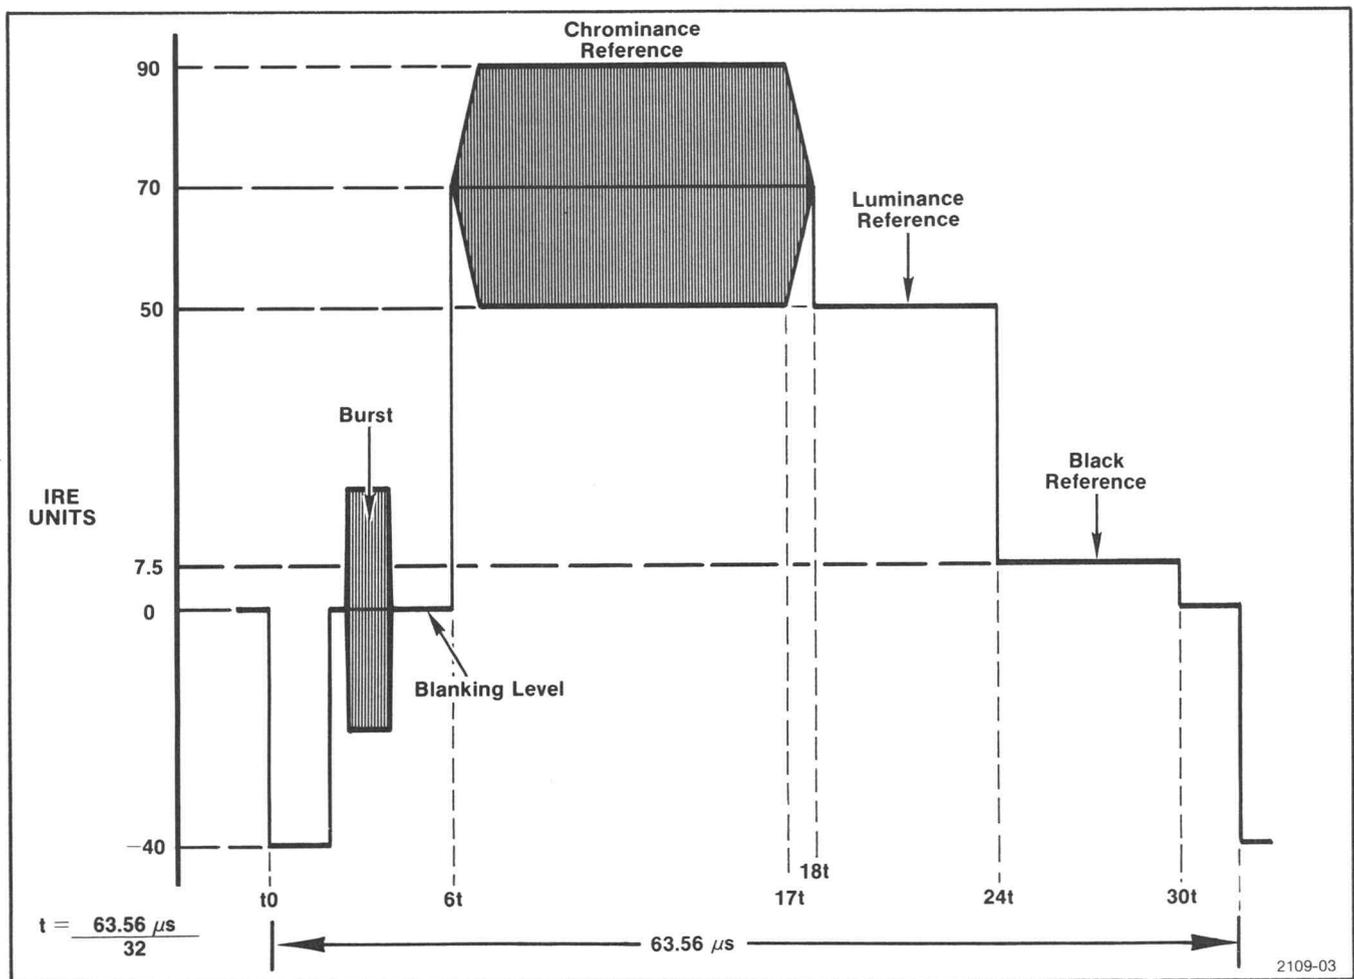

Fig. 4-5. The Vertical Interval Reference Signal.

THEORY OF OPERATION

This section is divided into two parts. First is a basic overview of instrument operation that describes circuit relationships and signal flow as illustrated by the Block Diagram. Second is a more detailed discussion of each of the circuit diagrams.

The circuit diagrams are blocked off according to circuit function. These circuit block titles are used as indices to the circuit diagram discussion.

The Block Diagram and circuit diagrams are located on fold-out pages at the rear of the manual. Refer to the appropriate diagram when reading this discussion.

Block Diagram Description

The heart of the SPG1 or SPG2 NTSC SYNC GENERATOR module is a 40-pin MOSLSI integrated circuit sync generator. This IC (found on the Sync Timing board A20, Diagrams 1a and 1b) is driven by a 640H (10.0699 MHz) oscillator and counts out sync and timing signals of the proper time and duration for operation of the rest of the 1410 system.

Oscillator frequency accuracy is maintained by comparing the leading edge of horizontal sync as generated by the sync generator IC to subcarrier phase. The subcarrier used can be either that generated in the 1410 Subcarrier Oscillator, an external subcarrier source, or an external source of composite video (in the SPG2 GEN LOCK mode). The phase comparison takes place on the Sync Lock board (A21) (see Diagrams 2a and 2b.)

Circuits on the Sync Lock (A21) board maintain the subcarrier to horizontal phase relationship and route reset information to the Sync Timing board (A20). In addition,

noisy signals, or signals with sync and subcarrier not locked, or conditions where horizontal lock has not taken place are detected and the proper command routed to the Generator Logic board (A22) to switch the SPG1 or SPG2 to INTERNAL mode.

The Generator Logic board (A22) contains the logic circuits that enable the SPG1 and SPG2 to react to the various front-panel switching commands. Outputs from A22 include drives for the front-panel LED indicators as well as enable/disable commands that cause the SPG1 or SPG2 to conform to existing conditions of front-panel switch positions and the presence or absence of external signals.

The Subcarrier Lock board (A23) is present only in the SPG2 module. Circuits on this board accept composite video from an external source and generate a control voltage for the 1410 subcarrier oscillator, a control level for the Sync Lock board that indicates a locked or unlocked subcarrier condition, and composite sync stripped from the incoming composite video signal.

The Pulse Output board (A24) accepts the sync and blanking signals from the Sync Timing board (A20) and shapes them for output. Each signal passes through one-half of a Tektronix-manufactured integrated circuit amplifier. Each amplifier provides the necessary drive for the output connectors.

The VIRS/Black Burst board (A25) uses the timing signals generated on the Sync Timing board (A20) to address a Programmable Read Only Memory which then produces the timing signals for the VIR Signal.

Subcarrier is modulated by timing signals generated on A25 then combined with luminance signals to form the VIR Signal at the output amplifier.

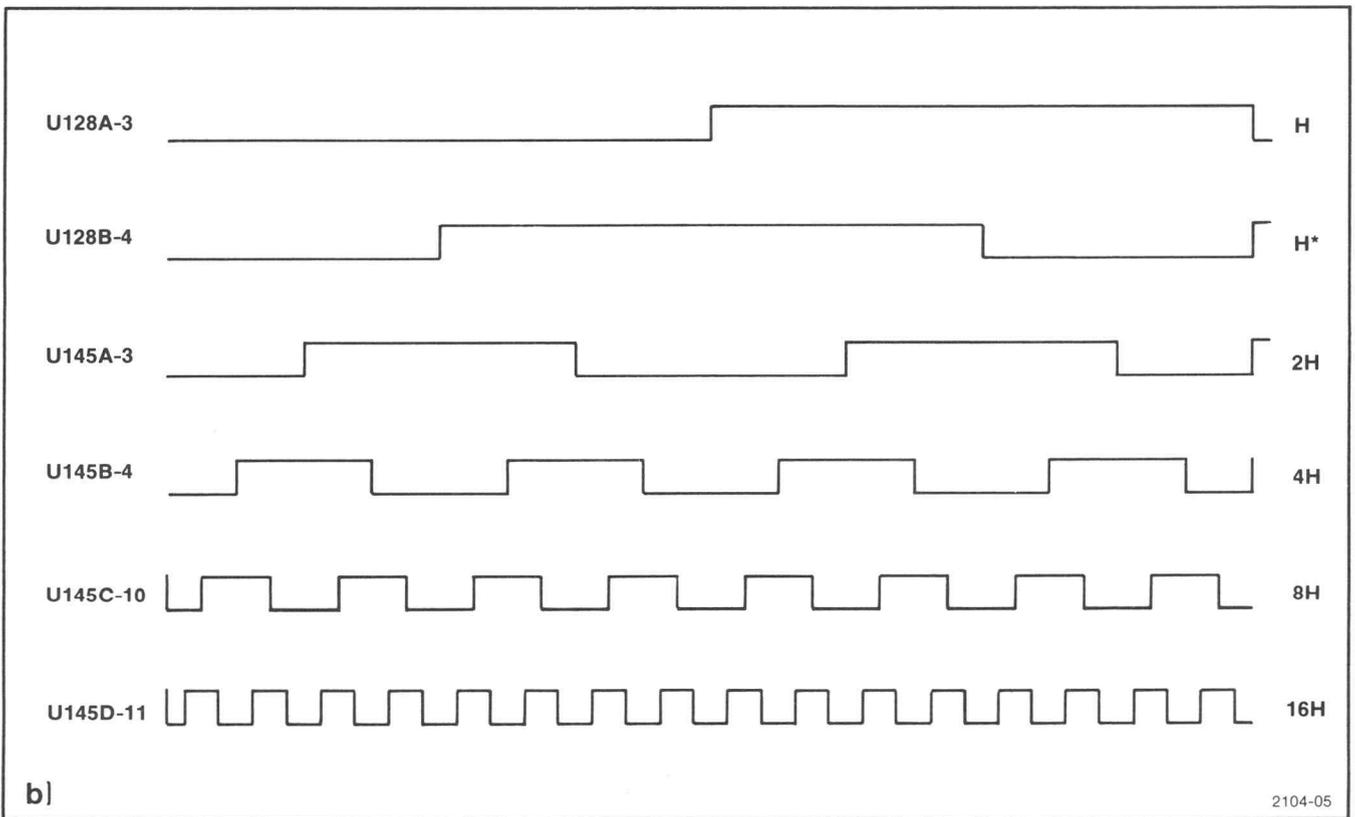

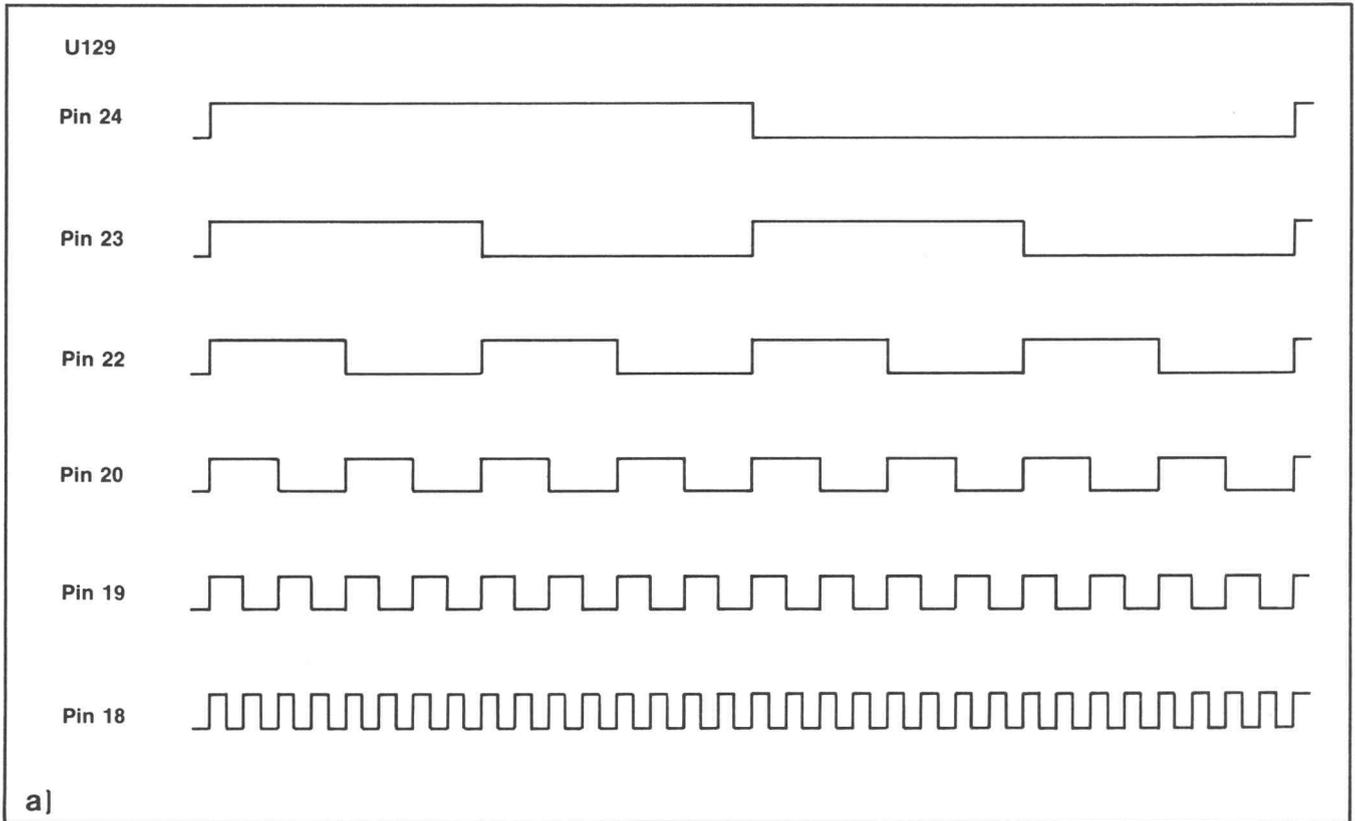

Fig. 5-1. H Timing diagram.

CIRCUIT DESCRIPTION

DIAGRAM a & b SYNC TIMING

Circuits on Diagrams 1a and 1b form the heart of the generator system. U129, a MOS/LSI circuit, generates the timing signals required for performance of the total system. U129 is clocked by a 5 MHz (320H), 2 phase pulse, which is derived from a 10 MHz (640H) oscillator. The outputs from U129 are either routed directly to the Interface board, or processed in one manner or another to produce necessary pulses.

DIAGRAM a

10 MHz Oscillator

Q157 is the active component of a Pierce Oscillator operating at 10 MHz. The frequency is determined by C159, C152, and L159, with frequency tuning controlled by C159. CR154 provides fine tuning of the oscillator frequency. The setting of C159 determines pull-in range of the oscillator.

Clock Drivers

The 10 MHz clock is divided by 2 and split into two phases by U152B and applied to two cascaded push-pull amplifiers. They amplify the two-phase 320H clock pulse required by U129. The TTL-amplitude signals at the outputs of U152B are stepped up to nearly 30 volts at the clock inputs (pins 13 and 14) of U129.

Sync Generator and Output Buffers

U129 is a MOS/LSI circuit that accepts the 320H clock pulses and generates timing pulses as required for operation of the rest of the system.

The 320H clock is counted down to 64H in U129. The 64H signal is then synchronously counted down (in U129) to H. Each interval of the countdown from 64H to H is an individual output of U129 (pins 17, 18, 19, 20, 22, 23, 24). The 64H derivatives from 32H to H are applied to a series of exclusive-or gates prior to the buffer amplifiers. The exclusive-or gates modify the sync generator outputs into a Gray Code reflection of the original signals. See H Timing Diagram, Fig. 5-1.

Each of the timing signals from U129 is applied to a buffer amplifier that reduces the signal amplitude, making it compatible with the TTL logic that follows.

The outputs of the Output Buffers are applied to the Interface board for routing to the rest of the system.

Burst Timing

The positive-going leading edge of the burst gate start pulse from U129 pin 32 clocks U126A. U126A is one-half of a dual monostable multivibrator with variable output pulse width as controlled by the external timing components C126, R117, and R119. Burst Delay control R119 is adjusted for breezeway width.

The trailing edge of the pulse from U126A pin 4 clocks U126B, the second half of the dual monostable multivibrator package, C127, R127, and R128 (the Burst Width control) are the external timing components for this device. R128 is adjusted for burst width. The output from U126B pin 12 is applied to the Interface board through U112A, which is an on-off gate controlled by the burst gate disable command from the Generator Logic board A22 (Diagram 3).

H Drive Timing

The H Drive signal on Interface board pin 7 is derived from one of two selectable sources. First, with P103 pins 2 and 3 shorted together, directly from sync generator circuit U129. Second, with P102 pins 2 and 3 shorted together, from D flipflop U102A. U102A receives its clock from the Variable H Blanking Start multivibrator U110B on Diagram 16. The time that pulse is generated depends on the setting of the H Blanking Start. The output of U102A goes high with the H Blanking Start clock pulse, beginning the variable H drive pulse. U102A's clear is set low at the end of H drive from U129, switching the output low again, ending the variable H drive pulse. See H Drive Timing Diagram Fig. 5-2.

Phasing Pulse Control

U115A generates a pulse of the type normally used in PAL television systems to regulate subcarrier phase on alternate horizontal lines. The output can be either a pulse or a square wave. H/2 is a square wave with its starting point at H Blanking start. This signal drives U115A D input, determining the output phase of U115A. U115A is clocked by a signal from U129 pin 24 that is coincident with line sync. If a square-wave is desired, P112 is open, leaving U115A's preset tied high. If a pulse output is desired, P112 connects U115A's preset to the H Drive pulse and U115A is reset at the end of H drive.

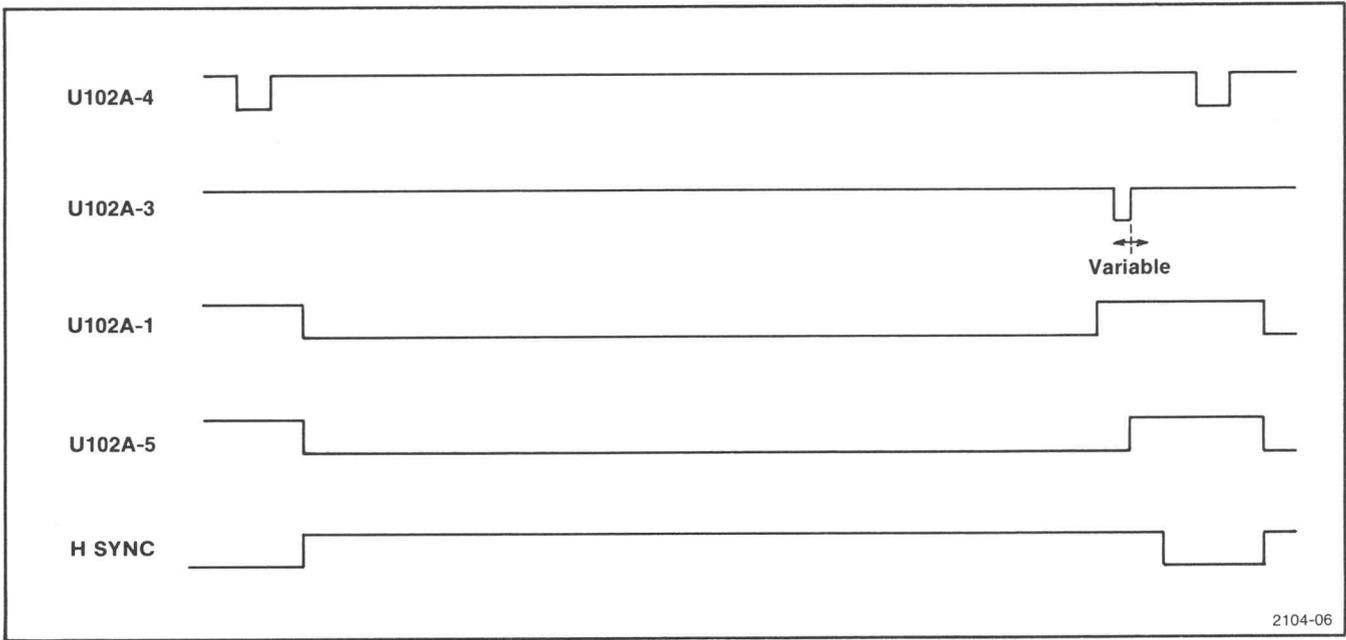

Fig. 5-2. H Drive Timing diagram.

DIAGRAM 1 b

Color Bar Timing

This circuit generates a series of pulses related to horizontal line timing used by the Color Bar Generator module TSG1 to time the individual bars sequence.

A two-stage 6-bit binary counter (U151 and U142) counts down from the 640H clock input to provide proper timing. The output timing is altered by command from the TSG1 when EIA color bars are desired.

U151 and U142 are data-loaded to counts determined by U141B and U141D, and U132A and U132B. In the full-field mode, the data load is a count of 63. The counter then divides by 65, resulting in a time between output pulses of 6.5 μ s.

In the EIA mode, interface line 47 is set to ground by the EIA switch in the TSG1 module. U141C and U146B alter the data load 3/4 of the way through the field. For the first 3/4 of the field, the counter is loaded to a count of 53. The counter divides by 75, resulting in 7.5 μ s bar widths. For the last 1/4 of the field the data load is changed to 34, the counter divides by 94, and the -I, W, and Q bars are generated. The Q output of U146B is also used by the TSG1 module to time the split-field displays. P144 determines the timing, either 1/2 field or 3/4, 1/4 field split.

The counter output is combined in U141A with a signal derived from horizontal blanking and routed to the TSG1 module via the Interface board. This output is also fed back to the counter load inputs to synchronize the count.

U148B and U146A form a timing circuit that determines the point on the line that the color bars begin. The time is controlled by R149, the Color Bars Horizontal Shift control.

Vertical Reset

This circuit locks the vertical counter in U129 to field 1 of the external reference signal in EXTERNAL and GEN LOCK modes.

Interface line 48 carries the field 1 identification pulse (field 1, line 6) from the Vertical Sync Detector on Generator Logic board A22 to the data input of U152A. In the fast Lock mode, U164A delays the pulse time by about 500 μ s as controlled by Vertical Phasing control R169. U164B sets a pulse width of about 40 μ s. The vertical reset pulse amplitude is increased to 15 V by U159B and is applied to U129 to reset the vertical counter. R169 advances or delays the vertical counter reset by one line.

Vertical Advance Delay

This circuit allows slower lock of the vertical counter in U129 to the external reference signal than the Vertical Reset circuit discussed previously.

The vertical reset pulse from U164B triggers the lock pulse in the slow lock mode. The vertical reset pulse is and'ed in U167C with a low output from U166B and gated through U167B to U159B and U129 under locked conditions. This ensures sustained lock of the U129 vertical counter to the external reference.

At the end of the V drive pulse, U162B generates a one-half-line timing pulse which passes down shift registers U161 and U160. Points along these shift registers are picked off to perform the desired timing functions.

U165C generates two clock pulses for U166B that cause U166B to generate an output between those two clock pulses. The output is of known polarity because of the V/2 preset. The output from U166B enables U167C to pass the vertical preset pulse from U164B during that output time. U166B Q output sets U166A D input high during that time so that if the vertical preset pulse is present, U166A Q output goes high indicating vertical lock.

U165B and D are used to generate a V/2 signal with edges coincident with normal vertical preset. U162A is clocked by incoming vertical preset so that if the vertical counter in U129 is not locked to incoming vertical preset, the output of U162A will enable U163 or U163D. Which gate is enabled, U163C or U163D, depends on relative position of the output of U165B and D compared with incoming vertical preset. This allows the vertical counter to be reset one line early (U163C or one line late (U163D) through gates U167A, U167D, and U167B, to bring the vertical counter into lock with the incoming signal.

When lock is acquired, U166A output is high and lock is maintained by the state of U166B providing a low input to U167C, allowing the vertical reset pulse to pass through to U159B.

Horizontal Phasing

U106 is loaded 16 μ s before horizontal sync and enabled 4 μ s before horizontal sync by commands from programmable read-only memory (PROM) U107. U129 supplies the 64H clock pulse. After a number of clock pulses, determined by the setting of S109, U106 generates a carry output pulse that is carried by interface line 3 to the Variable Delay circuit on Sync Lock board A21 (Diagram 2b). The timing of the load and enable commands permits delay of the carry output pulse for a time period extending from 4 μ s before horizontal sync to 10 μ s after horizontal sync.

Variable Horizontal Blanking

The two sections of U110, a dual monostable multivibrator, generate start and stop pulses for U102B, the Variable Horizontal Blanking generator. U110B initiates the blanking pulse, switching on the leading edge of the waveform from U107 pin 6. Duration of the start pulse is determined by the setting of U116 (H Blanking Start). U110A terminates the blanking pulse, switching on the trailing edge of the waveform from U107 pin 6. Duration of the stop pulse is determined by the setting of U115 (H Blanking Stop). The start pulse clocks U102B with its trailing edge, and the stop pulse trailing edge toggles U102B to terminate the blanking pulse. The time between

trailing edges of the start and stop pulses determines the duration of the Variable Horizontal Blanking pulse. The preset pulse at U102B pin 10 ensures the right polarity of U102B's Q output.

The blanking pulse is routed to P110, where it can be selected to become part of the composite blanking signal on interface line 10.

Variable Vertical Blanking

The leading edge of the V blanking waveform from U129 triggers U148A. U148A's output pulse duration is determined by R148, the Vertical Blanking Stop control. U148A's output sets U159B, and clears U159B at the end of its one-shot time constant. When U159B is cleared, its D input is high. If the H rate clock is present at the time, the variable vertical blanking pulse is generated. U159B output is applied to P111 where it can be selected to become part of the composite blanking signal on interface line 10.

DIAGRAMS 2 a & 2 b

SYNC LOCK

Circuits on Diagrams 2a and 2b accept sync and subcarrier from the selected sources, either internal or external, and generate the proper locking signals to phase-lock the Clock Oscillator on Sync Timing board A20 (Diagram 1a). The Clock Oscillator may be phase-locked to external line sync or subcarrier.

DIAGRAM 2 a

Subcarrier X2 Multiplier

Subcarrier to the other modules can be either locked to the 1410 3.58 MHz oscillator or is variable by turning the SUBCARRIER PHASE control. Refer to P339 on Diagram 2a. Note that the subcarrier applied to the Sync Lock board, A21, comes from either of two sources. With pin 1 of the connector connected to pin 1 of P339 on the circuit board, subcarrier reference comes from the SUBCARRIER PHASE control through the Pulse Output board, A24. With the connector reversed, subcarrier comes from the 1410 Subcarrier Input board, A13.

The outputs of U299A and U299D are at the subcarrier rate, but only one-fourth of a subcarrier cycle in duration. The in-phase output (U299A) is applied to U249B in Subcarrier/Horizontal Phasing circuit.

The outputs of the two pulse-narrowing networks are applied to U299C, which acts as a negative-input "or" gate. The output of U299C is twice the subcarrier rate with a 50% duty cycle and becomes the clock pulse for the divide-by-455 Horizontal Counter.

Horizontal Counter

The Horizontal Counter divides the twice-subcarrier-rate signal from the Subcarrier X2 Multiplier circuit by 455, generating an accurate H-rate signal at count 2048.

U289, U279, and U259 are loaded to a count of 1,592 by a command from U259's carry output. Following the load command, the counter is clocked by the 2X subcarrier signal from a count of 1,592 to 2048 dividing that clock by 455. In the internal mode of operation, the count to which the counters are loaded is never changed.

In the external mode of operation, the count can be altered by inputs from the Counter Reset Logic circuit. In the Slow-Slow Lock mode, the A and B inputs of U289 are loaded to add or subtract one count from the total if the Sync Phase Comparator circuit senses that the Counter H output is not in phase with input line sync. In the normal lock mode, horizontal sync from Generator Logic board A22 (Diagram 3) is used to reset the counter immediately through U200B, U249A and U255C.

Sync Phase Comparator

Horizontal sync, through U334A, switches diode switch CR270-CR271 (CR271 is normally conducting). Q260 generates a positive-going ramp that is clamped by Q262. At the falling edge of the signal on Interface line 87, the diode switch reverts to its normal condition, and the output of Q160 ramps back to ground.

The Q_A output of U259, which is an H-rate squarewave, is fed back to U285A. U285A and U285B time a sampling pulse (timing controlled by Preset Center control R276) to be in the center of the ramp that is generated by Q260. Q261 is turned off, turning Q252 on, allowing the ramp level at that time to be stored by memory capacitor C252. The memory level is applied through voltage follower U254A to quad comparator U205.

Each portion of U205 is preset by a section of a voltage divider to switch at some level of the sampled ramp voltage. When one of the comparators switches, the counter is reset as described earlier.

If the sample occurs on the falling portion of the ramp (after sync has ended), U240B and Q217 set the level on one input of U275C to ensure that the counter is shifted to allow the comparators to operate.

Counter Reset Logic

In the normal lock mode (P228 jumper connected to pins 2 and 3), a phase shift (sensed by the Sync Phase Comparator circuit) of sufficient amount to switch one of the reset portions of the comparator, feeds back to the clear input of U200B, enabling U200B to switch. U200B switches at the leading edge of the next horizontal sync pulse, presetting the Q output of U249A high. The high output from U249A loads the counter to the correct count (1,598). The Sync Phase Comparator output also disables the slow-slow lock loop with a low applied to U275B from U224A.

If the phase shift sensed by the Sync Phase Comparator is not sufficient to switch the reset portions of the comparator, either the retard or advance portion will act. The retard portion of the comparator operates when the Sync Phase Comparator senses that the counter output is leading the horizontal sync on interface line 87. In order to correct this lead, the counter must divide by 456. U255B pin 6 and U255A pin 3 are set low, resulting in a high level at U289 pin 4, and a low level at U289 pin 3.

At the next carry output from U259, the counter is loaded to a count of 1,591, allowing division by 456. U220B then triggers, switching the state of the counter back to divide by 455. If at the end of one-shot (U220B) time the phasing is still retarded, the same sequence is repeated.

If the Sync Phase Comparator senses that the counter is lagging horizontal sync, the count is similarly changed to 454 until the counter catches up.

In the slow-slow lock mode (P228 jumper connected to pins 1 and 2), U200B is always inhibited by the low clear command from U245D. The reset portions of comparator U205 now switch U275C, which in turn causes the count to be changed by one until an in-phase situation is regained. The retard and advance portions of the comparator operate as in the normal mode of operation. In the INTERNAL mode, the counter advance and retard functions are switched off through U255 pins 5 and 2, and the counter is preset through U255 pin 9.

Subcarrier/Horizontal Phasing

H/2 pulse from Sync Timing board A20 triggers U229B. U249B data input receives subcarrier-rate pulses from U299A and is clocked by the end of U229B one-shot time, timed by R219, the SCH Phase control. If U249B data input is low, at the time of the clock, the Q output goes low. When H/2 goes low, the Q output is preset high, triggering U220A, which in turn resets the horizontal counter in U129 on Sync Timing board A20.

Circuits on Diagram 2b sense the absence of burst and apply a low inhibit to U245C in monochrome conditions. This mode inhibits horizontal reset of the counter in U129 on Sync Timing board A20.

U220A is inhibited from generating a horizontal reset pulse when circuits on the Generator Logic board indicate absence of either horizontal or vertical lock and apply a low clear command via interface line 83.

Timing Jitter Detector

In the presence of an intermittently noisy signal or an unlocked sync-subcarrier condition, the subcarrier counter is continuously preset, causing U275A to pump current into memory cap C251 through Q284. If the noise persists, U254B's output becomes positive enough to gate a command through U224D that switches circuits on the Generator Logic board to switch to internal mode (if P224 is connected).

If sync and subcarrier are expected to be unlocked, P324 should be connected. This connection will cause the generator to lock to sync under sync-subcarrier unlocked conditions.

DIAGRAM 2 b

The circuits on Diagram 2b provide proper subcarrier to sync lock timing and inform Generator Logic board A22 when H lock is unsuccessful, allowing the SPG1 or SPG2 to switch to internal operation. The output from phase lock amplifier U284A keeps the 1410 subcarrier oscillator at the correct frequency.

Sync-Subcarrier Lock

The state of U334D's output determines whether the SPG1 or SPG2 locks to subcarrier or sync. With the instrument set for external operation and sync lock, the Q output of U240A is low, U334D pin 10 is high because of external operation, and U334D pin 11 is high because of the low output of U240A. The low output at U334D pin 9 inhibits U229A and enables U330D.

A horizontal-rate square-wave from U259 (Diagram 2a) is gated through U330D and clocks U325B. U325B enables ramp generator Q315 and a near-square ramp is applied to the emitter of Q304.

At the same time that the ramp is being started, H sync from Sync Timing board A20 clocks U200A. U200A output trailing edge clocks U325A. U325A generates a 500 ns sample pulse that occurs some time during the leading edge of Q315's ramp as determined by the HORIZ DELAY control. The sample pulse turns off Q312, which turns on Q304 and allows the ramp level at that time to be stored in memory capacitor C295.

Voltage follower U284B applies the level at C295 to phase-lock amplifier U284A, and to the H Unlock Detector circuit. U284A compares the output of U284B with its reference at pin 3 and applies correction voltage to the 640H oscillator via Interface line 55.

If the 640H oscillator is unlocked, the ramp and the sample pulse are no longer coincident. The output of U284B still follows whatever level appears at C295. A positive excursion by U284B output turns on Q294 via C298 and CR304. Q294 conduction turns on Q306, which switches the state of U324F output from high to low, signaling Generator Logic board A22 to indicate loss of sync and to switch to the internal mode.

At the same time, Q330 is turned off, turning on Q305. This places R296 (and R293 if slow-lock is selected) in parallel with R298, increasing the ac gain of U284A.

Q294 is held on by C307, holding Q306 on until the output of U284B settles down after re-acquiring lock. This ensures rapid phase-lock of the 640H oscillator.

With the instrument set for external operation and subcarrier lock, U240A pin 5 is high, causing U334D to enable U229A and disable U330D. U229A is clocked by H-rate signals counted down from subcarrier. The ramp is then referenced to subcarrier instead of sync.

Should the incoming subcarrier be lost, circuits on Generator Logic board A22 change the state of U240A data input. Another circuit on A22 applies a pulse via Interface line 57 that occurs at the sixth serration of the vertical pulse. That clock changes the state of U334D and switches back to sync lock. Remember that this action only takes place when the instrument is in subcarrier lock.

U330B, U334C, and U330C inhibit the sample pulse generator during the time that sync is missing.

With the instrument in internal mode, U334D selects subcarrier lock at all times.

DIAGRAM 3

VERTICAL SYNC AND GENERATOR LOGIC

Circuits on Diagram 3 provide the necessary synchronization switching functions and the logic required to alter the operation and front-panel indications of the SPG1 or SPG2 to conform to existing conditions.

Mode Switching

This circuit has four dc output lines (designated L, \bar{L} , K, and \bar{K}) that change logic levels as determined by the front-panel setting.

P374 and P366 enable or disable gen lock operation. The jumper should be on P374 if Subcarrier Lock board A23 is installed (SPG2), and on P366 if A23 is not installed (SPG1).

P365 connects the line K output to U386B when the HORIZONTAL LOCK switch is in the SUBCARRIER position. U386B pin 5 is low only in EXTERNAL mode and SUBCARRIER lock. This condition causes the SPG1 or SPG2 to lock internal sync to external subcarrier but not light the front-panel INTERNAL LED.

Sync Switching

The Sync Switching circuit selects sync from external, or in the case of SPG2, gen lock inputs and provides a starting pulse for the Sync Phase Comparator ramp generator on Sync Lock board A21 (see Diagram 2a).

U420B or U420D is enabled, depending on the Mode Switching circuit outputs. In the EXTERNAL mode, \bar{K} is high, enabling U420D and allowing external sync from the rear-panel COMP SYNC input to pass. U420C and U420A gate the sync through to the clock input of U426. U426 generates a positive-going pulse about 40 μ s in width, locking out the 24 pulses in the vertical interval.

In the GEN LOCK mode (SPG2 only), \bar{L} is high and \bar{K} is low, enabling U420B and passing sync from the Sync Separator circuit on Subcarrier Lock board A23. U426 operates in the same manner as in EXTERNAL.

A second output from U420A routes sync to Interface line 54 and to the Vertical Sync Detector.

Vertical Sync Detector

The negative-going sync pulses from U420A switch Q406 off as they arrive. During normal line sync, the line sync period is short enough that the change developed on C405 is not sufficient to turn Q405 on. During the vertical pulse time, however, the long vertical pulses do develop enough charge on C405 to turn Q408 on, generating a positive-going pulse for each of the six serrated vertical pulses. These pulses are applied to U400B as a clock, and to a pulse delay network, U406B, R402, C397, and U406F.

When U400B is clocked, a positive-going pulse longer than one-half line in duration is applied to U401A from U406F following the enable input and starts down the register.

Each of the following clock pulses has a similar effect on U400B and U401. U400B is not allowed to clear U401, and each time U401 is clocked the pulse is stepped one position along the register.

At the sixth clock pulse (corresponding to the sixth serrated vertical pulse), U401 output is picked off and routed to U406D and to sync present detector U400A. When U400A is clocked, its Q output goes high and Q low. The time constant is greater than one field in duration so the outputs remain in the same state as long as U401 generates a clock each field.

U401 output is also applied to U400B timing circuit via CR396, terminating U400B output and clearing U401.

Switching Logic

The outputs from the Switching Logic circuit are logic levels, with the exception of the vertical preset lines 48 and 57. The vertical preset pulses, however, are not present at lines 48 and 57 in INTERNAL mode since any external input is locked out in the Sync Switching circuit.

INTERNAL Operation. Line 52 (burst lock disable) is set low at all times in the INTERNAL mode because of output L from the Mode Switching circuit. This line goes to the Phase Lock Amplifier on Subcarrier Lock board A23, Diagram 4b.

External subcarrier line 56 is high at all times in the INTERNAL mode because of output K from the Mode Switching circuit disabling the four-input NAND gate formed by U389A, U389D, and U388A. This line goes to the Internal/External Subcarrier switch on Subcarrier Input board A13 in the 1410. See 1410 Diagram 3.

*Connection
OK
16 Aug 83*

Line 14 is the front-panel SYNC indicator drive. The mode of indication is selectable by positioning P387. In the sync absent position of P387, U385D is bypassed. The SYNC indicator is always off in the INTERNAL mode. P449 pin 3 routes a LED drive output, inverted from that on line 14, to the 1410 rear-panel REMOVE connector for use in remote indicators if desired.

Line 46 routes a command to the Sync Lock Logic circuit on Sync Lock board A21 (Diagram 2b) when burst is missing in the GEN LOCK mode. In the INTERNAL mode, line 46 is always high.

Line 1 drives the front-panel SUBCARRIER indicator. The mode of indication is reversible, depending upon the position of P383. In the subcarrier absent position of P383, U385A is bypassed. The SUBCARRIER LED is always off in the INTERNAL mode. P449 pin 1 routes a LED drive output, inverted from that on line 1, to the 1410 rear-panel REMOTE connector for use in remote indicators if desired.

Line 87 routes a signal from U426 in the Sync Switching circuit to the Sync Lock board A21 (Diagram 2a) for timing reference in EXTERNAL or GEN LOCK modes. In the INTERNAL mode, line 87 is always low.

Line 32 routes a video disable command, if desired, to all module locations. In the INTERNAL mode, line 32 is always low. In EXTERNAL or GEN LOCK modes, a high output on line 32 can disable video output upon loss of lock. With P380 in the "can" position, video is disabled upon loss of lock. With P380 in the "can't" position, line 32 is always low and can't disable video.

Line 4, burst gate disable, is always low in the INTERNAL mode, or when P380 is in the "can't" position. Line 4 goes to the Burst Gate Generator circuit on Sync Timing board A20, Diagram 1a. A high level on line 4 inhibits the burst gate.

Line 31 can disable the chrominance portions of composite video signals upon loss of lock, if P382 is positioned for it. In the INTERNAL mode, or with P382 in the "can't" position, line 31 is always low. A high on line 31 inhibits chrominance portions of signals in some modules.

Line 15 is the front-panel INTERNAL indicator drive. In the INTERNAL mode, or under some conditions of loss of lock, line 15 is low. P449 pin 2 is an external LED drive, inverted from that on line 15.

Line 85 routes a command level to the Sync Lock Logic circuit on Sync Lock board A21, Diagram 2a. In the INTERNAL mode, or under some loss of lock conditions, line 85 is low.

In the EXTERNAL mode, the Mode Switching outputs are altered to change the switching commands from the Sync Switching circuit.

With external sync present in the EXTERNAL mode, U400A pin 6 is high and pin 7 is low. U396A output is high if external subcarrier is not present, and low if external subcarrier is present. U406A output is low if U410A senses both H and V lock. U386D's output is high, and U388D's output is high, setting up the logic conditions for EXTERNAL operation.

The K output from the Mode Switching circuit is high in the EXTERNAL mode, allowing external sync from the 1410 rear-panel input to pass to the Vertical Sync Detector circuit. The high K level is also applied to U398B.

U398B also has high inputs from U386B and from Interface line 59 if external subcarrier is present or from R398 if P398 is in the Not Needed position. The Not Needed position of P398 eliminates the requirement for having external subcarrier present in the EXTERNAL mode.

U399D, seeing a low level at its input, applies a high level to the front-panel INTERNAL indicator, turning it off. U389C, sensing the high levels from U399D and U388D, applies a high level to line 85 to enable the Sync Phase Comparator on Sync Lock board A21, Diagram 2a. The high from U389C also enables U406D to pass vertical preset pulses to line 48. The rest of the logic outputs operate similarly to the INTERNAL mode until one of the external signals disappears.

If the external sync is lost, U410A, U426A, and U400A all switch states. U386A disables video outputs, if P380 is in the "can" position. U398A's output switches high, setting line 85 low and turning on the front-panel INTERNAL indicator. U389B senses two low inputs and turns on the front-panel SYNC indicator, assuming P387 is in the Sync Absent position.

If external subcarrier is lost, line 59 is low, causing U396A output to be low. That turns on the front-panel SUBCARRIER indicator, assuming P383 is in the Subc Absent position. The low on line 59 also causes U398B to turn on the front-panel INTERNAL indicator and switch line 85 low.

Theory of Operation—SPG1/SPG2

The HORIZONTAL LOCK switch does not affect circuits on this diagram as long as external sync is present and P365 is in the "needed" position.

If the HORIZONTAL LOCK switch is in the SUB-CARRIER position, and P365 is in the "not needed" position, the low K output causes U386B to maintain the Switching Logic circuit in the external mode.

In the SPG2 GEN LOCK mode, sync arrives via line 53 from Subcarrier Lock board A23, and the subcarrier lock signal arrives via line 51, again from A23. The Switching Logic circuit reacts to these inputs similarly to the EXTERNAL mode.

DIAGRAM 4 a and 4 b SUBCARRIER LOCK

Circuits on Diagrams 4a and 4b receive composite video from an external source, and generate a control voltage for the Subcarrier Oscillator in the 1410, a lock signal for Sync Lock board A22, and composite sync.

DIAGRAM 4 a

Chroma Amplifier

The Chroma Amplifier consists of the Chroma Pickoff, and three operational amplifiers in series with an Automatic Gain Control (AGC) circuit.

Chroma Pickoff. C735 and L734 form a series resonant LC trap. The subcarrier components of the input signal are separated from the low-frequency components and applied to the Chroma Buffer Amplifier.

Chroma Buffer Amplifier. Q725 and Q715 form an operational amplifier with a gain of 5. The output is regulated by the AGC circuit and applied to the Limiting Amplifier.

AGC Operation. CR729 and CR736 form a gain control circuit. This circuit regulates the subcarrier signal current from the Chroma Buffer Amplifier by shunting a portion of that current through CR736 to ground.

The amount of signal current shunted to ground depends on the relative impedances of CR736 and CR729. If the input signal is large, the AGC control voltage from

Diagram 4b decreases the conduction (increases the impedance) of CR729. The signal current then has a lower impedance path through CR736 and less signal current reaches the Limiting Amplifier.

If the input signal is small, the AGC control voltage decreases CR729's impedance and the signal current has a lower impedance path to the Limiting Amplifier.

Limiting Amplifier. Q718 and Q719 form an operation amplifier with the feedback resistor shunted by two diodes (CR699 and CR708). The two diodes limit the peak-to-peak signal amplitude at the amplifier output at about 1.2 volts.

Output Amplifier. Q665 and Q666 form an operational amplifier that provides adequate drive current for the demodulators. L679 (Subcarrier Phase) is adjusted to compensate for phase changes caused by the amplifiers.

Sync Stripper

U700 is a Tektronix manufactured sync stripper circuit. Composite video, from an external source, arrives at the input and composite sync is the output. If the input signal contains sound-in-syncs, the position of P690 can be selected to delete that signal.

R707 is adjusted for proper timing of the sound-in-syncs deletion. R749 is adjusted for proper sampling point on a ramp generated in U700. The proper timing of the sample ensures that noise during video time will not cause U700 to change its timing. The Sync Stripper output is routed via the 1410 Interface board to Generator Logic board A22, and through R680 to the Clamp Timing Circuit.

Clamp Timing

Negative-going composite sync from Generator Logic board A22 turns off CR680, turning off Q670 after a time set by R673 and C650. When Q670 turns off, Q686 also turns off. This all happens during back porch time so that the incoming signal burst is allowed to pass to the demodulators. Subsequent circuitry matches the 1410 subcarrier phase to the incoming burst phase. The clamp pulse from Q670 is also applied to the Burst Detector and AGC circuit on Diagram 4b.

With P685 in the Cancel position (pins 1 and 2 connected), Q686 is also off during sync time. This means that the demodulators see residual subcarrier on sync tip as well as burst. The effect on the 1410 subcarrier is to cancel the phase error due to residual subcarrier.

Demodulators

The output of the Chroma Amplifier is applied to three integrated circuit demodulators (U639, U626, and U630). U639, the In-Phase Demodulator, and U626, the Quadrature Demodulator, compare the chroma signal at their + and - signal inputs to the 1410 subcarrier signal at their + carrier inputs. The output is proportional to the phase difference between the input signals. Both operate in the same manner, but U626 receives subcarrier shifted 90° in phase by L645 and C653.

U630 receives the signal from the Chroma Amplifier at its signal inputs and + subcarrier input, and operates as a self-synchronous detector. The output is proportional to the input chrominance amplitude and is not affected by phase.

All three outputs pass through shaping filters that remove any subcarrier component and through buffer amplifiers. The buffer amplifier outputs are applied to the Phase Control, Lock Detector, Burst Detector and AGC circuits on Diagram 4b.

The clamp pulse from Q565 causes Q578 to sample the level at the output of the In-Phase Demodulator buffer amplifier during burst time. This level is fed through U619 to U639 to ensure that the buffer amplifier output is at zero volts during burst time.

DIAGRAM 4 b

The three demodulators outputs plus the output of the Clamp Timing circuit are applied to the inputs of the three major circuits on Diagram 4b. The Clamp Timing output and the Amplitude Detector output enable a two-transistor gate (Q550 and Q560). When Clamp Timing and Amplitude Detector outputs coincide (burst time), the gate enables the memory circuits at the inputs of the Phase Control circuit, the Lock Detector circuit, and the Burst Detector and AGC circuit.

The instantaneous voltage levels at the inputs of the three circuits are stored in memory capacitors and applied through voltage followers to the rest of the circuits.

Phase Control

The output of the In-Phase Demodulator is applied to the memory portion of the Phase Control circuit. The instantaneous level during burst time is stored in C528 by Q539 and routed through voltage follower U489B to error amplifier U489A. The level at the input of the error amplifier is inverted and amplified and applied to the Control Voltage Switching circuit. The error signal is picked off at the wiper of R456 and routed to the 1410 Subcarrier Oscillator to control the oscillator varicap.

The error amplifier output is fed back through Darlington transistor Q465 to the error amplifier input. The Darlington configuration is used so that the current demand by the feedback loop does not affect the frequency control with temperature changes. C456 rate-limits the level changes the amplifier can make.

Q469 is a band switch circuit used to change the slew-rate of the amplifier by changing the input impedance. If fast lock is desired, P459 is connected around R459. The input impedance is then R469 in parallel with R479. For slow lock, P459 is open and the amplifier input impedance is R459 and R469 in parallel with R479.

Q469 is on only when the Lock Detector circuit detects a "no-lock" condition. When the circuit is locked, the junction of R467 and R468 is at +0.6 volt and the band switch is off.

Lock Detector

The output of the Quadrature Demodulator is stored in memory capacitor C552 during burst time. The memory level passes through voltage follower U510D to Q470, the Lock Detector delay circuit.

Before lock acquisition, Q470 is on, Q472 is not charged, Q462 is on, and Q463 is off. The junction of R467 and R468 is referenced to -15 V and the band switch (Q469) is on. During lock acquisition, the output of U510D goes far enough positive to turn Q470 off, allowing C472 to charge towards +15 V. After about 200 ms, Q462 turns off and the multivibrator switches states. When Q463 turns on, the band switch is turned off, and Q460 turns off, removing the 0 volt unlock level from Interface line 51.

Burst Detector and AGC

The output of the Amplitude Detector is stored in memory capacitor C563 and applied through voltage follower U510A to two circuits. U510C is connected as a Schmitt circuit, with a positive output when burst is present. U510B is a rate-limited amplifier with an output that is less negative the larger the input burst. U510B's output is applied to the Chroma Amplifier gain cell on Diagram 4a. U510A's output is applied to the Control Voltage Switching circuit.

Q545 inhibits the clamp timing pulse if Interface line 52 goes to 0 volt. This condition is present when the SPG2 is in the INTERNAL mode, or when the gen-lock signal is lost.

Theory of Operation—SPG1/SPG2

Control Voltage Switching

With the circuit locked, the positive output from U510C turns off Q474, Q464, and Q475. The 1410 Subcarrier Oscillator control is directly from U489A in this condition.

When unlocked, U510A's output is negative, turning Q474, Q464, and Q475 on. The 1410 Subcarrier Oscillator is then controlled by the setting of R456 as a voltage divider between -15 volts and ground.

DIAGRAM 5

Diagram 5a Pulse Output Amplifiers

The circuits on Diagram 5a accept signals from Sync Timing board A20 (see Diagrams 1a and 1b), and drive loads connected to the 1410 rear-panel output connectors. Each integrated circuit contains two completely independent amplifiers with rise and fall times matched and controlled by external timing capacitors (designated "Rate" on the diagram).

The output level excursion for each amplifier is from 0 to -8 volts open circuit, and 0 to -4 volts when terminated in 75 Ω at the 1410 rear panel connectors.

In most cases, the signal received from the Sync Timing board is processed through its amplifier and applied to the 1410 Rear Interconnect board. Two signals, however, get some prior processing before being applied to the amplifier.

The BURST FLAG output is developed from the Burst Flag Start pulse from the Sync Timing board. U810A delays the pulse for a period of time controlled by R800. U820B sets the duration of the pulse (adjustable by R821). When the two controls are properly adjusted, the BURST FLAG pulse is the width of burst and centered on burst time. If the SPG1 or SPG2 is in an external lock mode and set for chroma disable, the level at Interface line 31 inhibits the BURST FLAG output (via U790C) upon loss of lock.

The FIELD REF output is a one-line pulse that can be generated on Field 1, line 11 or Field 3, line 10. If P836 is set for Field 1, line 11, the signal on Interface line 37 is applied via U835A directly to the pulse amplifier, U829B. If P836 is set for Field 3, line 10, however, U825, a dual D-type flipflop, divides the V/2 clock by two, generating a V/4 pulse. The V/4 pulse clocks U826, the next toggle flipflop. U826's preset input prevents U826 from toggling until U825A's Q output is high. Conditions are correct at Field 3.

At Field 3, line 9, U826 is cleared to toggle, and a low level is applied to U825A's D input. The next horizontal sync pulse clocks U825A and the Field 3, line 10 FIELD REF pulse is passed to the output amplifier, U829B.

Diagram 5b Subcarrier Output

The circuit on Diagram 5b receives subcarrier from the Subcarrier Oscillator in the 1410, passes it through the phase shifter (goniometer), and applies it to the 1410 Interface board and the 1410 Rear Interconnect board.

Subcarrier from the 1410 Subcarrier Input board A13 passes through the front-panel SUBCARRIER PHASE control to an amplifier formed by Q755, Q767, and Q768. The output load for this amplifier is the tank circuit at the collector of Q768. The tank circuit is tuned for subcarrier frequency, with C779 providing amplitude control.

The output of the tank circuit is applied to the subcarrier output amplifier consisting of Q776, Q775, and Q784. This unity-gain amplifier provides the necessary low-impedance drive for signal distribution.

DIAGRAM 6

A25 VIRS/BLACK BURST

PROM Timing Generator

U921 is a Programmable Read Only Memory (PROM) that derives the VIRS timing signals. The PROM is addressed by drive signals from the SPG module causing its outputs to produce the timing signals shown in Fig. 5-1.

CR933, CR941, and CR943, and CR952 are negative-logic current steering diodes driven by the outputs of U921. If pin 7 is high, CR941 will turn on, steering emitter current away from Q841, which turns off current drive through the transistor. When the PROM's output goes low, current drive resumes and causes a current corresponding to 70 IRE to appear at the Luminance Filter output. The 50 IRE, 7.5 IRE, and chrominance levels are similarly generated.

VIRS Drive

U859 is a synchronous binary counter connected to produce a VIRS pulse for use at U921. U855A controls the VIRS pulse output depending on the position of the VIRS pushbutton switch. The counter is clocked by composite sync from U853D. The load input is driven by vertical drive from U851C. Line 18 or Line 19 may be selected by grounding pin 15 or pin 1 with the jumper connector.

Sync and Setup Drive

Gate U815D passes composite blanking and vertical drive when the Black Burst/Full Field Ref pushbutton is in the Full Field Ref position thus enabling U921 to generate the full field VIR signal. U851B passes the VIRS pulse which enables U921 during Line 18 or Line 19. Q955 and Q962 provide current during composite sync time and setup time.

Modulator

U918 is a double-balanced modulator that produces at its output (pins 6 and 9) sidebands proportional to the product of the input signal voltages (pins 1 and 4) and the carrier signal (pins 7 and 8). The modulated chrominance output signal is coupled by T928 to the Chrominance Bandpass Filter. This filter provides a bandpass response whose center frequency is tunable by L938 and L948 to 3.58 MHz. The signal then passes through the Chrominance Gain control to the Output Amplifier.

Burst Drive

Q903 is turned on during burst time to provide burst drive current to the Modulator. The burst gate signal is filtered and shaped in the collector circuit.

Subcarrier AGC and Limiter

This circuit ensures that the Modulator is always driven with a constant subcarrier signal amplitude. The circuit also maintains correct input waveform symmetry to provide balanced drive to the Modulator.

Q880 provides isolation from the subcarrier source. C865 and L863 provide adjustment of TSG4 subcarrier phase to 1410 subcarrier phase. The subcarrier signal is limited to a 50% duty cycle at the collector of Q875. Paraphase amplifier Q876 and Q878 provides AGC and drives push-pull output stages Q897 and Q898. Thus, the subcarrier signal at T908's secondary is of constant amplitude and shape.

Output Amplifier

This circuit is a non-inverting operational amplifier that combines chrominance and luminance at its summing input, provides dc level and gain adjustments, and presents a low impedance at its output. There is sufficient output to drive two 75 Ω external loads.

MAINTENANCE

INTRODUCTION

This section is divided into three parts: Maintenance, Troubleshooting, and Repair.

Maintenance includes inspection, cleaning, and recalibration. Troubleshooting contains information for isolating a trouble to a component. Repair includes procedures for removing and replacing components.

MAINTENANCE

A regular schedule of maintenance can improve instrument reliability. How often the maintenance is performed should be determined by the severity of the operating environment. Turn off the instrument power and remove the power cord before cleaning the module.

Cleaning

Dust accumulating on the circuit board acts as an insulating blanket, preventing efficient heat dissipation, and possibly causing overheating and component breakdown. A layer of dust can also provide an electrical conduction path, especially under high humidity conditions.

CAUTION

Avoid the use of chemical cleaning agents that might damage the plastics used in this instrument. Avoid chemicals that contain benzene, toluene, xylene, or similar solvents.

The best way to remove heavy accumulations of dust is to blow it off with dry, low-velocity air jet. Remaining dust can be removed with a small brush followed by a soft cloth dampened in a mild detergent and water solution. A cotton-tipped applicator is useful in tight places.

WARNING

THE FOLLOWING SHOULD BE PERFORMED BY QUALIFIED SERVICE PERSONNEL ONLY.

Visual Inspection

Visually inspect the circuit board or boards during the maintenance routine for such defects as broken connectors, loose or disconnected pin connectors, improperly seated transistors and integrated circuits, and damaged components. Make sure that the boards are properly seated on the 1410 Mainframe Interface jacks. Boards with shields should be parallel to each other and held firmly by the plastic clips provided for this purpose.

The corrective procedure for most visible defects is obvious; however, care must be taken to determine and correct the cause of heat-damaged components. Heat damage is sometimes an indication of trouble elsewhere in the instrument.

Multi-Pin Connectors

Board output signals are fed to the rear-panel connectors through coaxial cable and multi-pin connectors. The connector holder has identification numbers that identify terminal connectors No. 2 and up. A triangular key symbol is also located on the circuit board to identify pin No. 1 (see Fig. 6-1) so that the connector can be properly oriented.

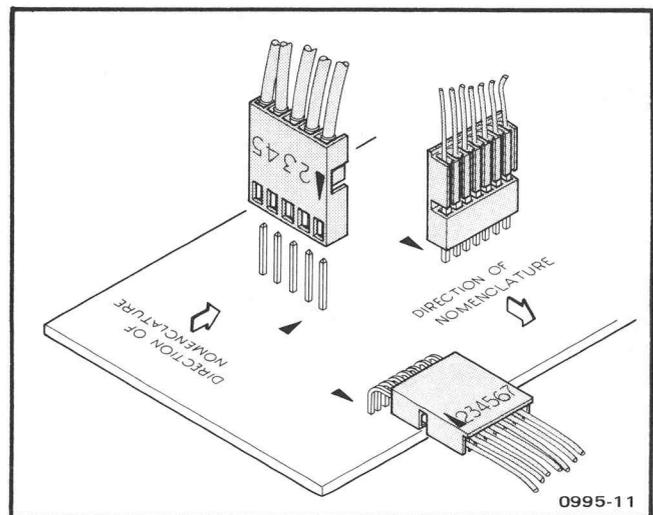

Fig. 6-1. Multi-pin circuit board connector.

Transistor and Integrated Circuit Checks

Periodic transistor and integrated circuit checks are not recommended. The best performance check for these devices is actual operation of the instrument. Performance of the circuit is thoroughly checked during the performance check or calibration procedure. Any sub-standard transistors or integrated circuits will usually be detected at that time.

Recalibration

The length of time between recalibration depends on the amount of use the circuitry receives, the nature of the environment, and the change in performance when some components are replaced.

In general, a partial recalibration is necessary if the components replaced affect the board calibration. Complete recalibration is recommended if the board or boards are not operating to their full capability. To ensure correct and accurate operation, performance should be checked at regular intervals; for example, after 1000 hours of operation if used continuously, or every six months if used infrequently.

A Performance Check/Calibration Procedure is given in Section 4.

TROUBLESHOOTING

Information contained here may be used as a guide in locating circuit failures. The schematic diagrams, circuit description, and calibration sections should be referred to for fast, efficient location and repair of defects.

Diagrams

Circuit diagrams are shown on the foldout pages in Section 9. The circuit and electrical value of each component is shown on the diagrams. Important waveforms are also shown.

Circuit Boards

The circuit boards are outlined in blue on the schematic diagrams. Circuit board illustrations are provided on the back of the foldout pages that precede the relevant diagrams. The assembly number assigned to each circuit board is an abbreviated method for identifying the board.

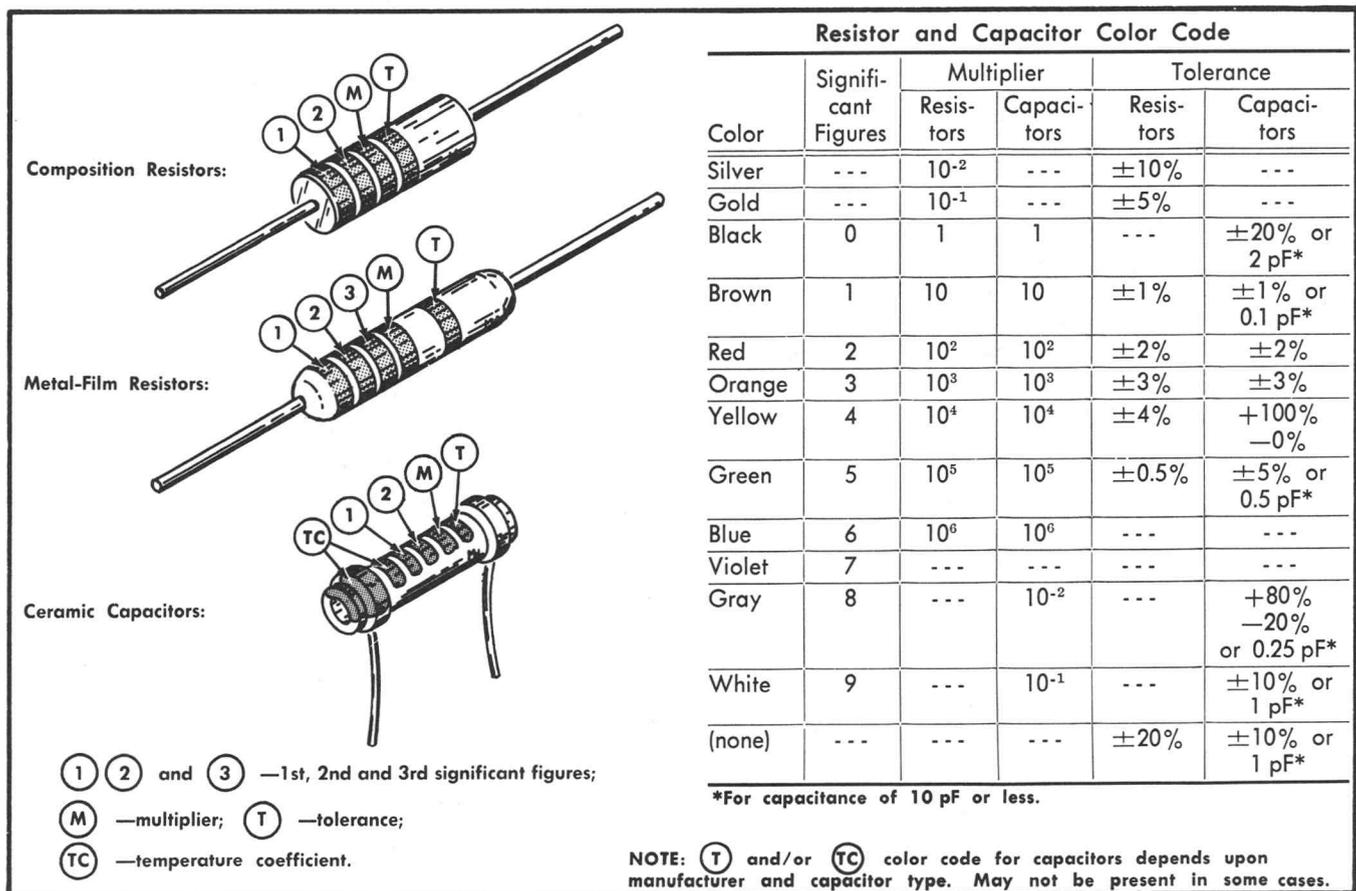

Fig. 6-2. Color Code for resistors and ceramic capacitors.

When troubleshooting the circuit boards in the instrument, the use of an extender board facilitates access to the board connections and components. Removing the suspected circuit board to the extender board will save time in looking for faults. Carefully align the board pin connectors to ensure good contact.

Circuit numbers are assigned on a grid system to facilitate component location. Low numbers start at the lower front corner of the board increasing to the rear and top.

Troubleshooting Charts

Troubleshooting charts are shown in "decision-tree" format in Section 8, Servicing Illustrations, of this manual. While the charts for an instrument as complex as the SPG1 or SPG2 cannot be inclusive, they will provide valuable assistance in troubleshooting procedures.

Wire Color Code

Insulated wires are color-coded to facilitate circuit tracing.

Resistor Color Code

Color stripes on resistors signify electrical values, tolerances, etc., according to the EIA standard color code (see Fig. 6-2). Resistors not color-coded usually have the value imprinted on the body.

Capacitor Markings

The capacitance value of a common disc capacitor or small electrolytic is marked in microfarads on the side of the component body. White ceramic capacitors are color coded in picofarads using a modified EIA code (see Fig. 6-2). The "tear drop" capacitors are color-coded in microfarads using a modified EIA code, with the dot indicating both temperature and positive (+) side. See Fig. 6-3.

Rated Voltage VDC 25°C	Color	CODE FOR CAPACITANCE IN PICO FARADS		
		1st Figure	2nd Figure	Multiplier—pF
4	Black	0	0	None
6	Brown	1	1	X 10
10	Red	2	2	X 10 ²
15	Orange	3	3	X 10 ³
20	Yellow	4	4	X 10 ⁴
25	Green	5	5	X 10 ⁵
35	Blue	6	6	X 10 ⁶
50	Violet	7	7	X 10 ⁷
	Gray	8	8	
3	White	9	9	

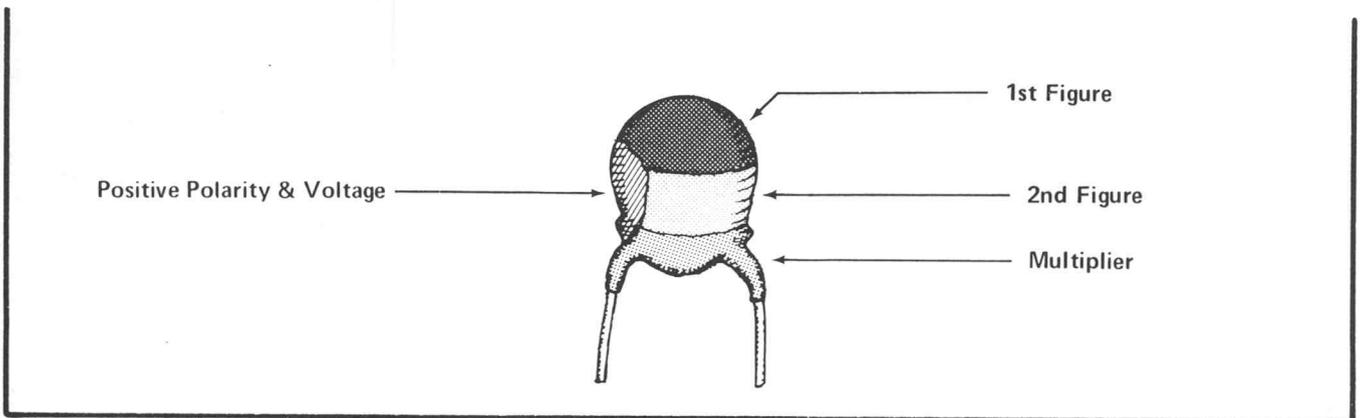

Fig. 6-3. Color coding for dipped tantalum "tear drop" capacitors.

Transistor and Integrated Circuit Lead Configurations.

Fig. 6-4 illustrates the lead configurations for the socket-mounted transistors and integrated circuits (IC) used on the circuit board.

IC Diagrams

Positive logic functions of the IC's are shown in Section 8 of this manual.

Troubleshooting Equipment

The following test equipment is useful for troubleshooting the generator circuit boards.

1. Test Oscilloscope. For viewing waveforms at various test points in the circuit. Frequency response: dc to at least 10 MHz. It should be equipped with a 10X probe.

2. DVM and Ohmmeter. For measuring dc voltages and resistances accurately. The ohmmeter is also required for checking continuity.

3. Semiconductor Tester. Some means of testing the transistors and diodes is helpful. A transistor-curve tracer such as the Tektronix Type 577 will give the most complete information.

Troubleshooting Procedure

This procedure starts with simple, but sometimes taken-for-granted problem areas and proceeds to detailed troubleshooting.

1. Check Control Settings. Incorrect control settings or wrong internal jumper positions can indicate a trouble that does not exist. If there is any question about the correct function or operation of any control or jumper, refer to the Operating Instructions or Installation sections.

2. Check Associated Boards. Before troubleshooting a board, check that the Sync Timing board is operating properly and supplying the correct signals to the Mainframe Interconnect board. Make sure that other boards on the Interconnect board are not defective. Check that the test oscilloscope probe, if used, is not defective.

3. Isolate Trouble to a Circuit. Symptoms will often identify the circuit in which the trouble is located. Incorrect operation of all circuits often means trouble in the power supply section of the Mainframe. Consider this possibility if voltages are incorrect. Make sure that all board pin connectors are making good contact before proceeding with trouble isolation.

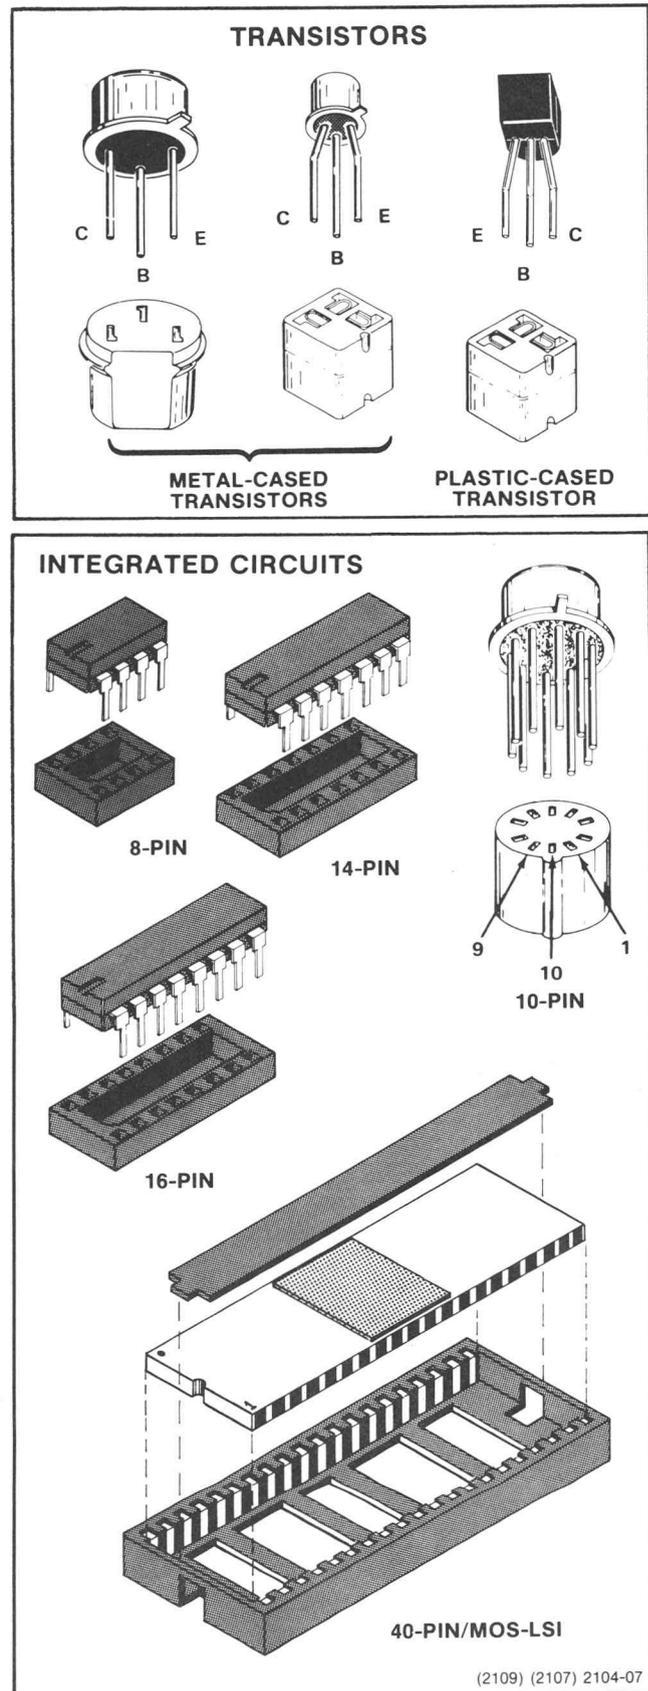

Fig. 6-4. Basing diagram for semiconductors.

4. **Visual Check.** Visually check the portion of the board in which the trouble is suspected. Some troubles can be located by checking for unsoldered connections, broken wires, loosely seated transistors, loose-fitting connectors, damaged components, or damaged circuit boards.

5. **Check Voltages and Waveforms.** Often the defective component or stage can be located by checking for the correct voltage or waveform in the circuit. Typical waveforms are given near the diagram. To obtain operating conditions similar to those used to take these waveforms, refer to the instructions at the start of the diagram section.

CAUTION

Due to component density on the circuit board, special care should be exercised when using meter leads and tips. Accidental shorts can cause abnormal voltages or transients that may destroy many components.

WARNING

"Ground lugs" are not always at ground potential. Check the diagram before using such connections as ground for meter prods or oscilloscope probes. Some transistor cases may be elevated from ground potential.

6. **Check Individual Components.** After the trouble has been isolated to one circuit or stage, the next step is to isolate the trouble to one component or part. Components that are soldered in place are best checked by disconnecting one end to isolate the measurement from the effects of surrounding circuitry. The following methods are provided for checking individual electrical components in the module.

a. **Transistors.** The best check of transistor operation is actual performance under operating conditions. If a transistor is suspected of being defective, it can be checked by substituting a new component or one which has been checked previously. However, be sure that the circuit conditions are not such that a replacement transistor might also be damaged. If substitute transistors are not available, use a dynamic tester (such as the Tektronix Type 577) to check the transistor.

b. **Integrated Circuits.** Integrated circuits should not be replaced unless they are actually defective. The best method for checking these devices is by direct substitution with a new component or one which is known to be good. Be sure that circuit conditions are not such that a replacement component might be damaged.

c. **Diodes.** A diode can be checked for an open or shorted condition by measuring the resistance between terminals. Use an ohmmeter, set to the 1k scale to keep from damaging the diode, for measuring the diode resistance. The resistance should be very high in one direction and very low when the ohmmeter leads are reversed.

d. **Resistors.** Resistors can be checked with an ohmmeter: Check the Replaceable Electrical Parts list for the tolerance of the resistors used in the instrument. Resistors normally do not need to be replaced unless the measured value varies widely from the specified value.

e. **Inductors and Switch Contacts.** Check for an open circuit (that should normally be closed) by checking continuity with an ohmmeter.

f. **Capacitors.** A leaky or shorted capacitor can best be detected by checking the resistance with an ohmmeter on the highest scale. Do not exceed the voltage rating of the capacitor. An open capacitor can best be detected with a capacitance meter or by checking whether the capacitor passes ac signals.

REPAIR

Corrective maintenance consists of component replacement and circuit board repair. Special techniques required to replace components in this instrument are given here.

Soldering Techniques

WARNING

Disconnect the instrument power cord before soldering.

Reliability and optimum performance of circuit boards can be maintained only if proper soldering techniques are used when repairing or replacing parts. Soldering techniques that apply to maintenance of precision electronic equipment should be used when working on the boards. Use only 60/40 rosin-core, electronic grade solder. The choice of soldering iron is determined by the repair to be made. When soldering on circuit boards, use a 15- to 25-watt pencil-type soldering iron with a 1/8-inch wide, wedge-shaped tip. Keep the tip properly tinned for best heat transfer to the solder joint. A higher wattage soldering iron may separate the etched wiring from the base material. Avoid excessive heat; apply only enough heat to remove the component or to make a good solder joint. Also, apply only enough solder to make a firm solder joint; do not apply too much solder. Use a desoldering tool or other device when it is necessary to remove excess solder.

Maintenance—SPG1/SPG2

The pencil-type soldering iron used on the circuit boards can be used for soldering to switch terminals, potentiometers, or metal terminals mounted in plastic holders. For ground lugs that are connected to the chassis, or other metal terminals that are connected to a large heat-radiating surface, use a higher wattage rating soldering iron with a larger tip.

After soldering is completed, clean the area around the solder connection with a flux-remover solvent. Be careful not to remove any information printed in the area.

Location Guide for Replacing Parts

The exploded view drawings associated with the Replaceable Mechanical Parts list (located at the rear of the manual) are helpful in the removal or disassembly of individual components or subassemblies. Circuit board illustrations are provided on the backs of fold-out pages in the Diagrams section of this manual.

Pushbutton Switch Replacement

Before removing a pushbutton switch, disengage the pushbutton actuating arm so that it does not project beyond the rear of the switch. Next carefully pry back the plastic retainer clip at the rear of the switch with the tip of a small screwdriver (see Fig. 6-5). Remove by lifting the switch body up and back from the front retainer clip.

Reverse the removal procedure to install the replacement switch.

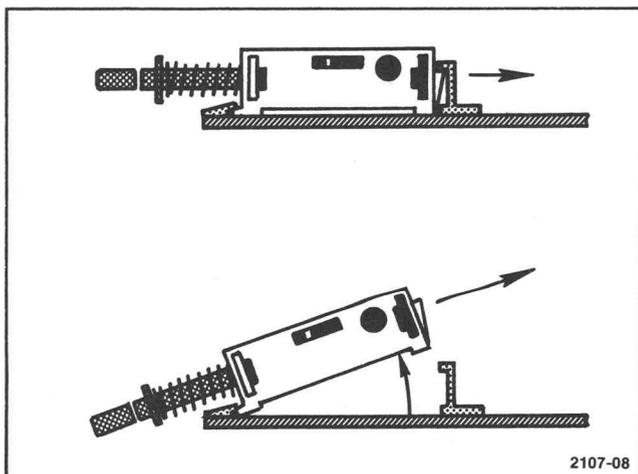

Fig. 6-5. Pushbutton switch replacement.

Circuit Board Replacement

If a circuit board is damaged beyond repair, the entire assembly, including all components, can be replaced. Tektronix part numbers are given in the Replaceable Electrical Parts list.

Circuit Board Removal.

1. Disconnect the multi-pin connectors from the board. Note the order of these connectors so they can be correctly replaced. Disconnect any other connectors that are used for interconnection with other circuits.

2. Disengage the front-panel knobs by pulling them straight out from the front panel until the board controls are free. Remove the plastic retaining clips from the top of the boards.

3. Grasp the board at both ends and pull straight up from the Interface board.

4. To replace the board, reverse the order of removal. Use the mating plastic guides to align the board pin connectors. Match the triangle key symbol on the multi-pin connectors to the same symbol on the board.

5. An extracting tool should be used to remove the 14- and 16-pin integrated circuits to prevent damage to the pins. This tool is available from Tektronix, Inc. Order Tektronix Part No. 003-0619-00. If an extracting tool is not available, use care to avoid damaging the pins. Pull slowly and evenly on both ends of the IC. Try to avoid having one end of the IC disengage from the socket before the other end.

Interconnecting pins. To replace a pin that is mounted on a circuit board, first disconnect any pin connectors. Then, unsolder the damaged pin and pull it out of the board with a pair of pliers. Be careful not to damage the wiring on the board with too much heat. Ream out the hole in the circuit board with a 0.031-inch drill. Remove the ferrule from the new interconnecting pin and press the new pin into the hole in the circuit board. Position the pin in the same manner as the old pin. If the old pin was bent at an angle to mate with a connector, bend the new pin to match the associated pins.

NOTE

A pin replacement kit including necessary tools, instructions, and replacement pins is available from Tektronix, Inc. Order Tektronix Part No. 040-0542-00.

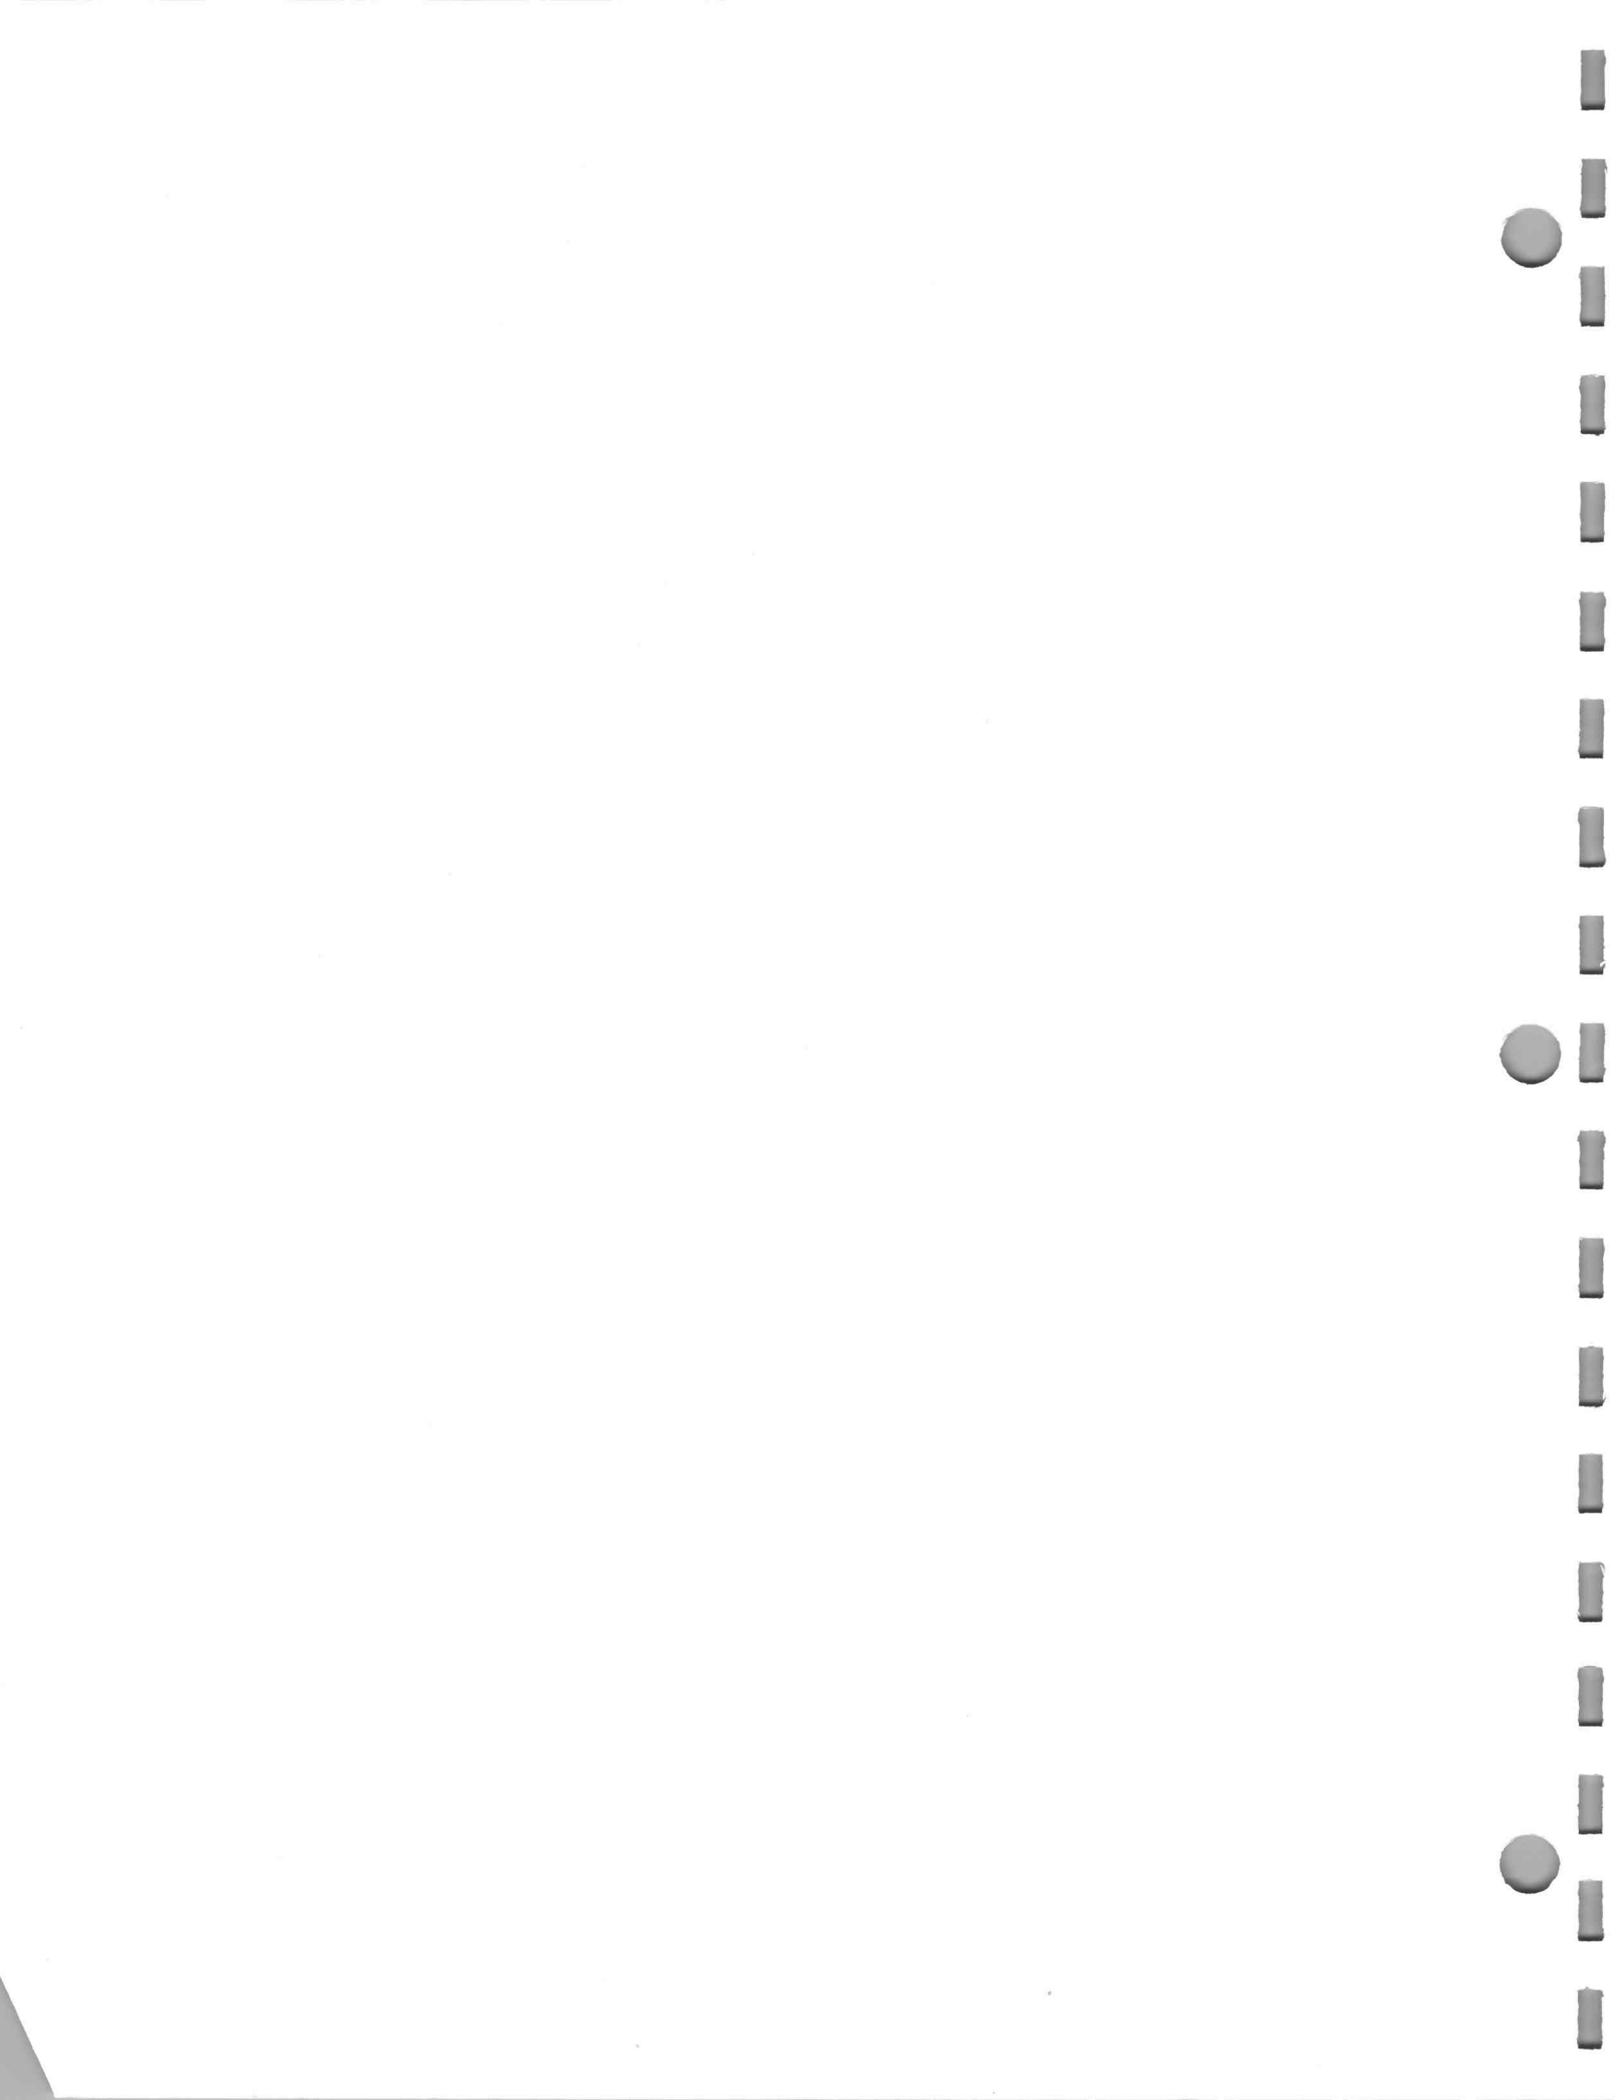

Transistors and ICs

Transistors and ICs should not be replaced unless they are actually defective. If removed from their sockets during routine maintenance, return them to their original sockets. Unnecessary replacement or transposing of semiconductors may affect the calibration of the board.

Disconnect the instrument power before removing or replacing semiconductors.

Any replacement component should be of the original type of a direct replacement. Cut and shape the leads to conform with the component being replaced. After a component is replaced, check the operation and calibration of associated circuits.

REPLACEABLE ELECTRICAL PARTS

PARTS ORDERING INFORMATION

Replacement parts are available from or through your local Tektronix, Inc. Field Office or representative.

Changes to Tektronix instruments are sometimes made to accommodate improved components as they become available, and to give you the benefit of the latest circuit improvements developed in our engineering department. It is therefore important, when ordering parts, to include the following information in your order: Part number, instrument type or number, serial number, and modification number if applicable.

If a part you have ordered has been replaced with a new or improved part, your local Tektronix, Inc. Field Office or representative will contact you concerning any change in part number.

Change information, if any, is located at the rear of this manual.

SPECIAL NOTES AND SYMBOLS

X000 Part first added at this serial number
00X Part removed after this serial number

ITEM NAME

In the Parts List, an Item Name is separated from the description by a colon (:). Because of space limitations, an Item Name may sometimes appear as incomplete. For further Item Name identification, the U.S. Federal Cataloging Handbook H6-1 can be utilized where possible.

DIAGRAMS AND CIRCUIT BOARD ILLUSTRATIONS

This section of the manual contains block and schematic diagrams with waveforms and etched circuit board illustrations.

Symbols

Symbols used on the diagrams are based on ANSI Y32.2-1970 and IEEE No. 315 March 1971. Logic symbology is based on ANSI Y32.14-1973 (IEEE Std. 91-1973). Logic symbols depict the logic function performed and may differ from the manufacturer's data.

Component Values

Electrical components shown on the diagrams are in the following units unless noted otherwise:

Capacitors Values one or greater are in picofarads (pF).
 Values less than one are in micofarads (μ F).

Resistors Ohms (Ω).

Semiconductor Types

Refer to the Electrical Parts List.

Reference Designators

The following letters are used as reference designators to identify components or assemblies on Tektronix, Inc. schematic diagrams.

A	Assembly, separable or repairable (circuit board, etc.)	LR	Inductor/resistor combination
AT	Attenuator, fixed or variable	M	Meter
B	Motor	P	Connector, movable portion
BT	Battery	Q	Transistor, silicon-controlled rectifier, or programmable unijunction transistor
C	Capacitor, fixed or variable	R	Resistor, fixed or variable
CR	Diode, signal or rectifier	RT	Thermistors
DH	Decoupling Hybrid	S	Switch
DL	Delay Line	T	Transformer
DS	Indicating device (lamp)	TC	Thermocouple
E, SG	Spark Gap	TP	Test Point
F	Fuse	U	Assembly, inseparable or non-repairable (integrated circuit, etc.)
FL	Filter	V	Electron tube
H	Heat dissipating device (heat sink, heat radiator, etc.)	VR	Voltage regulator (zener diode, etc.)
HR	Heater	Y	Crystal
J	Connector, stationary portion		
K	Relay		
L	Inductor, fixed or variable		

Partial Schematic Diagram With Explanations

The partial diagram at the left is an example of the various symbols and other information provided on Tektronix, Inc. diagrams.

Transformer Wiring

A two-letter abbreviation color code is used to identify wires without terminal connection labels.

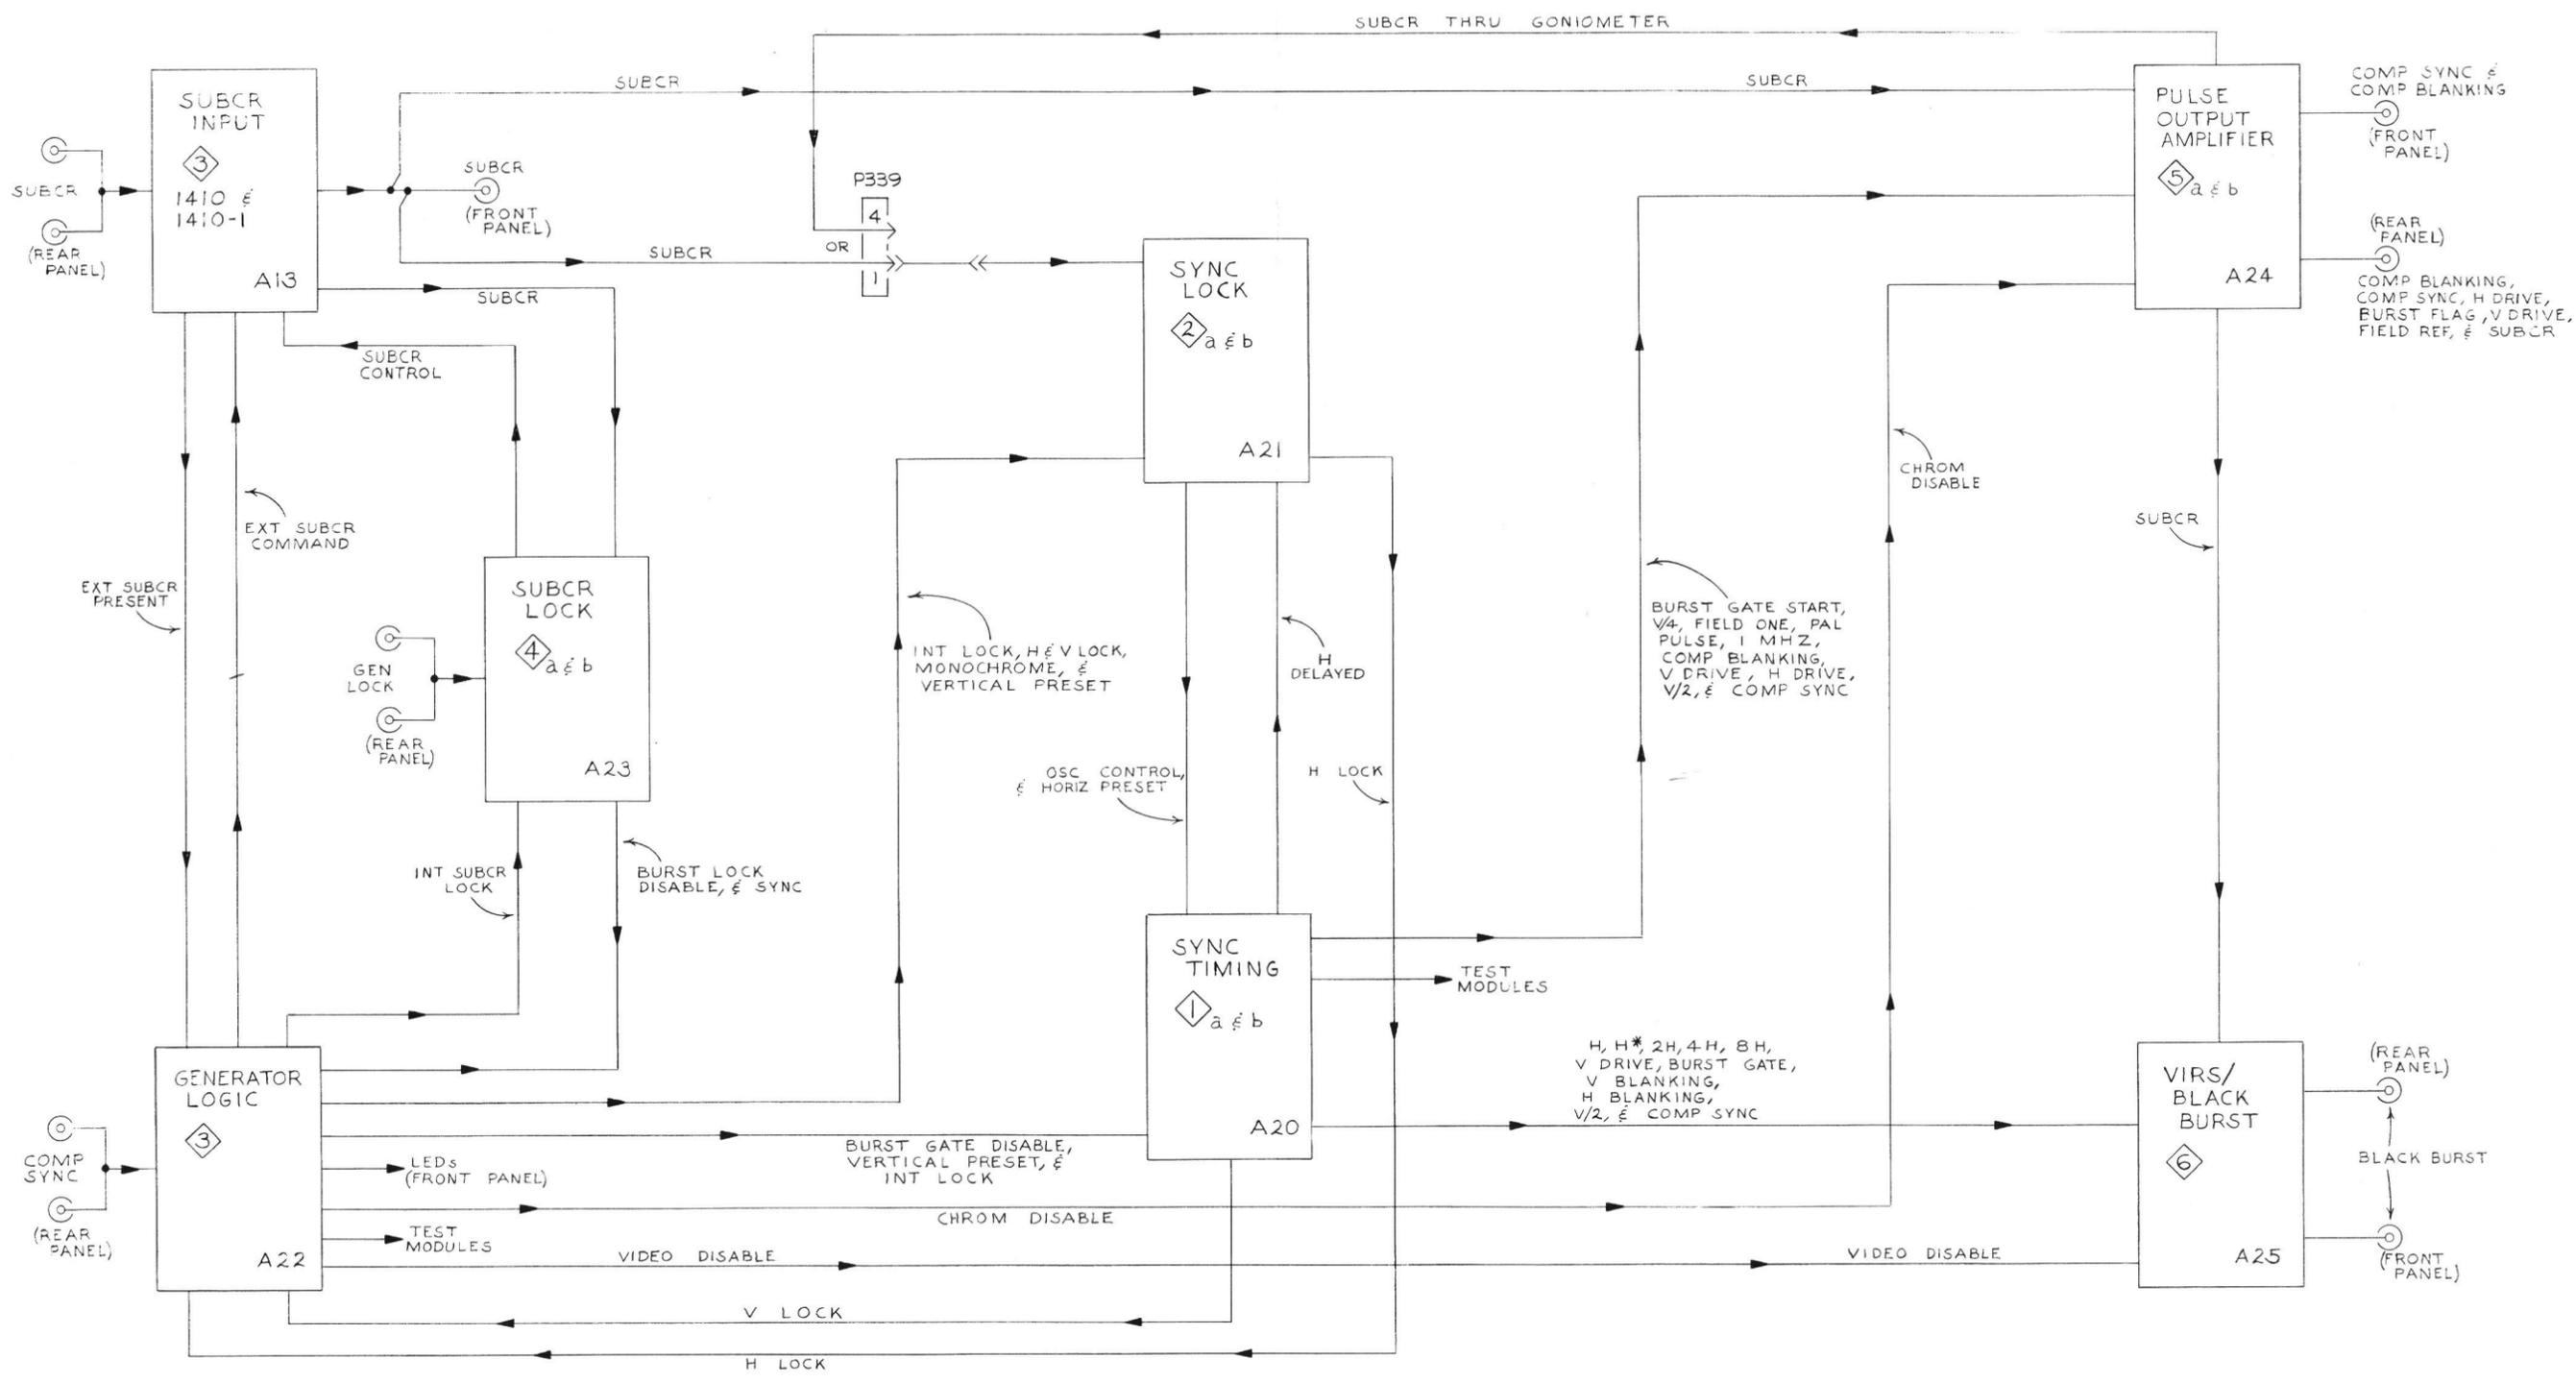

Bk	Black	G	Green
Br	Brown	Bl	Blue
Rd	Red	Vi	Violet
Or	Orange	Gy	Gray
Yl	Yellow	W	White

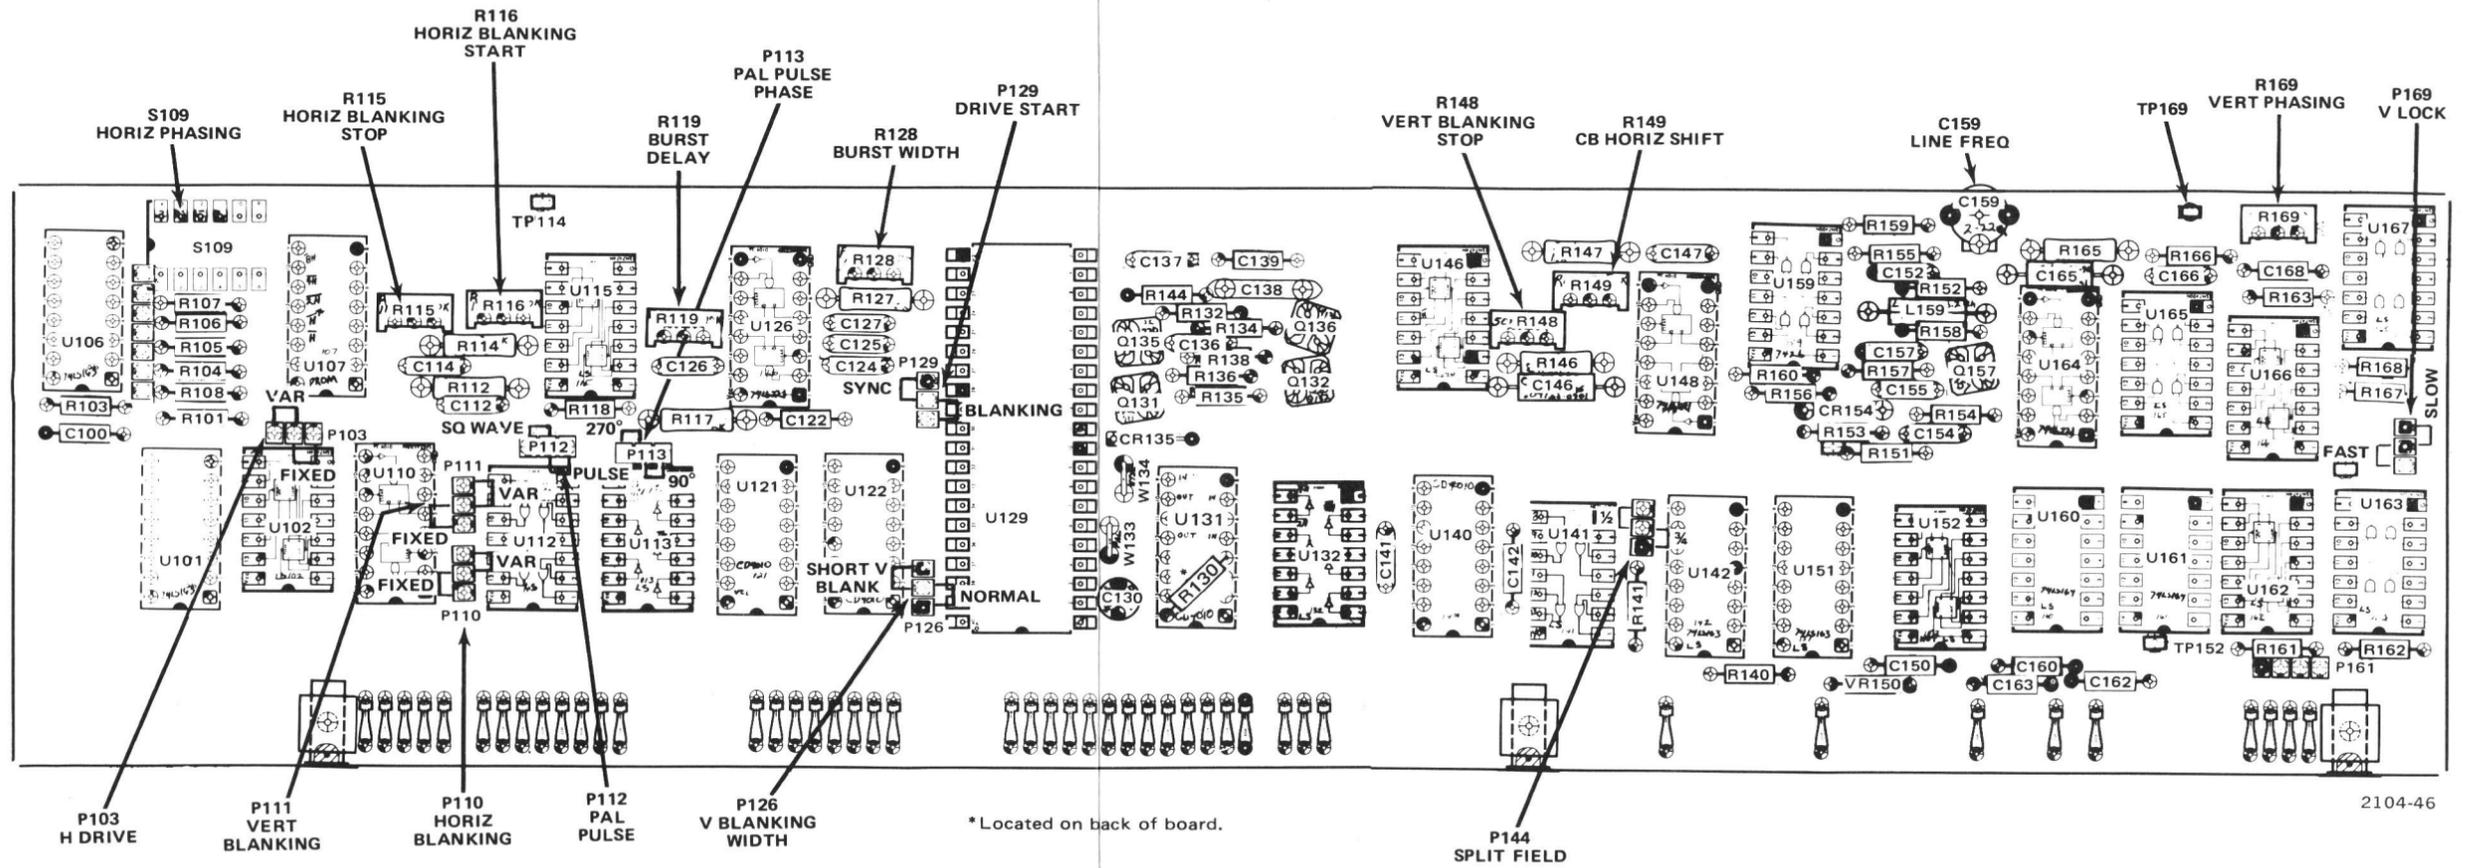

WAVEFORM CONDITIONS

Waveform photographs in this section were taken with a TEKTRONIX C-59 Oscilloscope Camera mounted on a TEKTRONIX 7603 Oscilloscope with 7B53A Time Base and 7A13 Differential Comparator plug-ins.

The vertical input was dc coupled except for those waveforms identified as ac coupled.

REPLACEABLE MECHANICAL PARTS

PARTS ORDERING INFORMATION

Replacement parts are available from or through your local Tektronix, Inc. Field Office or representative.

Changes to Tektronix instruments are sometimes made to accommodate improved components as they become available, and to give you the benefit of the latest circuit improvements developed in our engineering department. It is therefore important, when ordering parts, to include the following information in your order: Part number, instrument type or number, serial number, and modification number if applicable.

If a part you have ordered has been replaced with a new or improved part, your local Tektronix, Inc. Field Office or representative will contact you concerning any change in part number.

Change information, if any, is located at the rear of this manual.

SPECIAL NOTES AND SYMBOLS

X000 Part first added at this serial number
00X Part removed after this serial number

FIGURE AND INDEX NUMBERS

Items in this section are referenced by figure and index numbers to the illustrations.

INDENTATION SYSTEM

This mechanical parts list is indented to indicate item relationships. Following is an example of the indentation system used in the description column.

```

1 2 3 4 5           Name & Description
Assembly and/or Component
Attaching parts for Assembly and/or Component
    --- * ---
Detail Part of Assembly and/or Component
Attaching parts for Detail Part
    --- * ---
Parts of Detail Part
Attaching parts for Parts of Detail Part
    --- * ---
  
```

Attaching Parts always appear in the same indentation as the item it mounts, while the detail parts are indented to the right. Indented items are part of, and included with, the next higher indentation. The separation symbol --- * --- indicates the end of attaching parts.

Attaching parts must be purchased separately, unless otherwise specified.

ITEM NAME

In the Parts List, an Item Name is separated from the description by a colon (:). Because of space limitations, an Item Name may sometimes appear as incomplete. For further Item Name identification, the U.S. Federal Cataloging Handbook H6-1 can be utilized where possible.
