## INSTRUMENT SERIAL NUMBERS

Each instrument has a serial number on a panel insert, tag, or stamped on the chassis. The first number or letter designates the country of manufacture. The last five digits of the serial number are assigned sequentially and are unique to each instrument. Those manufactured in the United States have six unique digits. The country of manufacture is identified as follows:

B000000 Tektronix, Inc., Beaverton, Oregon, USA
100000 Tektronix Guernsey, Ltd., Channel Islands
200000 Tektronix United Kingdom, Ltd., London
300000 Sony/Tektronix, Japan
700000 Tektronix Holland, NV, Heerenveen, The Netherlands

## OPERATORS SAFETY SUMMARY

The general safety information in this part of the summary is for both operating and servicing personnel. Specific warnings and cautions will be found throughout the manual where they apply, but may not appear in this summary.

## TERMS

## In This Manual

CAUTION statements identify conditions or practices that could result in damage to the equipment or other property.

WARNING statements identify conditions or practices that could result in personal injury or loss of life.

## As Marked on Equipment

CAUTION indicates a personal injury hazard not immediately accessible as one reads the marking, or a hazard to property including the equipment itself.

DANGER indicates a personal injury hazard immediately accessible as one reads the marking.

## SYMBOLS

## In This Manual

This symbol indicates where applicable eautionary or other information is to be found.

## As Marked on Equipment

DANGER—High voltage.
Protective ground (earth) terminal.
ATTENTION—refer to manual.

## Power Source

This product is intended to operate from a power source that will not apply more than 250 volts rms between the supply conductors or between either supply conductor and ground. A protective ground connection by way of the grounding conductor in the power cord is essential for safe operation.

## Grounding the Product

This product is grounded through the grounding conductor of the power cord. To avoid electrical shock, plug the power cord into a properly wired receptacle before connecting to the product input or output terminals. A protective ground connection by way of the grounding conductor in the power cord is essential for safe operation.

## Danger Arising From Loss of Ground

Upon loss of the protective-ground connection, all accessibile conductive parts (including knobs and controls that may appear to be insulating) can render an electric shock.

## Use the Proper Power Cord

Use only the power cord and connector specified for your product.

Use only a power cord that is in good condition.

For detailed information on power cords and connectors, see maintenance section.

Refer cord and connector changes to qualified service personnel.

## Use the Proper Fuse

To avoid fire hazard, use only the fuse of correct type, voltage rating and current rating as specified in the parts list for your product.

Refer fuse replacement to qualified service personnel.

## Do Not Operate in Explosive Atmospheres

To avoid explosion, do not operate this product in an explosive atmosphere unless it has been specifically certified for such operation.

## Do Not Remove Covers or Panels

To avoid personal injury, do not remove the product covers or panels. Do not operate the product without the covers and panels properly installed.

## SERVICE SAFETY SUMMARY

## FOR QUALIFIED SERVICE PERSONNEL ONLY

Refer also to the preceding Operators Safety Summary.

## Do Not Service Alone

Do not perform internal service or adjustment of this product unless another person capable of rendering first aid and resuscitation is present.

## Use Care When Servicing With Power On

Dangerous voltages exist at several points in this product. To avoid personal injury, do not touch exposed connections and components while power is on.

Disconnect power before removing protective panels, soldering, or replacing components.

## Power Source

This product is intended to operate from a power source that will not apply more than 250 volts rms between the supply conductors or between either supply conductor and ground. A protective ground connection by way of the grounding conductor in the power cord is essential for safe operation.

## SPECIFICATION

## INTRODUCTION

## Description

The TEKTRONIX TM 506A Power Module is a sixcompartment mainframe for the TM 500-Series of modular instrumentation. It accepts up to six independently functional plug-in modules to form a compact, versatile and low cost instrumentation system. The TM 506A is a basic power source for plug-in modules of the TM 500 Series family. It provides unregulated dc and ac supplies and non-dedicated power transistors for plug-in usage.

## Accessories

Refer to the accessories list in the Replaceable Mechanical Parts list at the rear of this manual for part numbers.

Standard Accessories<br>1 Instruction Manual<br>1 Power Cord (U.S.)

## Options

Refer to the Options section of this manual for information on instrument options.

## Performance Conditions

The values listed below are valid only when the instrument is operated at an ambient temperature between $0^{\circ} \mathrm{C}$ and $50^{\circ} \mathrm{C}$.

## OPERATING INSTRUCTIONS

## INTRODUCTION

This section of the manual contains instructions on preparing the power module for use, installing plug-in modules, and repackaging the power module.

## Power Source

The TM 506A is designed to operate from a power source with its neutral at or near earth (ground) potential with a separate safety-earth conductor. It is not intended for operation from two phases of a multi-phase system.

## WARNING

AC POWER SOURCE AND CONNECTION. This instrument operates from a single-phase power source. It has a three-wire power cord and two-pole, three-terminal grounding-type plug. The voltage to ground (earth) from either pole of the power source must not exceed the maximum rated operating voltage, 250 V .

Before making connection to the power source, determine that the instrument is adjusted to match the voltage of the power source, and has a suitable two-pole, three-terminal grounding-type plug. Refer any changes to qualified service personnel.

GROUNDING. This instrument is safety class I equipment (IEC designation). All accessible conductive parts are directly connected through the grounding conductor of the power cord to the grounding contact of the power plug.

The power input plug must only be inserted in a mating receptacle with a grounding contact. Do not defeat the grounding connection. Any interruption of the grounding connection can create an electric shock hazard.

For electric shock protection, the grounding connection must be made before making connection to the instrument's input or output terminals.

## Power Usage/Loading Considerations

With six plug-in modules installed, the TM 506A can require up to 375 W of power at the upper limits of the high line voltage ranges. Actual power consumption depends on the particular module combination and operating mode selected at any one time.

The power capability of the TM 506A can best be used by carefully planning the plug-in configuration, the external loads, and the resulting power distributions. Optimum conditions may be obtained by:

1. Having equal loads in all compartments.
2. Dissipating as much power as possible in the external loads.
3. Operating the system in an ambient temperature near $25^{\circ} \mathrm{C}$.

Each plug-in is provided access to a pair of heat-sinked. series-pass transistors-one NPN and the other PNP. These transistors enable the plug-in to operate in power ranges not possible if the power were to be dissipated within the plug-ins.

## Fuse Replacement

To check or replace a fuse, perform the following

1. Turn off the power to the power module, and disconnect the power cord from the instrument.
2. See Fig. 2-1. To check or replace the Main Power Fuse, press downward on the tab located on the Line Voltage Selector just above the power cord receptacle. The door will open, and the fuse can be inspected or replaced.
3. Close the door to reconnect the fuse.
4. To check Power Supply fuses, use a small screwdriver to remove each of the three fuseholders, located on the rear panel, on the right-hand side when viewing the rear panel. Remove and replace fuses as required.

## note

The fuse value labeling on the instrument rear panel should read: "4A SLOW and 2A SLOW".

Fig. 2-1. Line Voltage Selection and Main Fuse Replacement.

## Line Voltage Selection

The line voltage selector is part of the line cord plug assembly, located on the rear of the power module. Verify that the voltage shown in the selector window is correct for the line voltage available.

If the displayed voltage selection is incorrect or the fuse needs replacement, perform the following procedure. Refer to Fig. 2-1. (The voltage is indicated by the red-marked window.)

1. Make certain that the power module power switch is turned off and the line cord is not plugged into the line voltage connector.
2. See Fig. 2-1. Press downward on the tab located on the Line Voltage Selector just above the power cord receptacle. This opens the selector door.
3. Using a small screwdriver, gently pry, first on one edge, then the other, to remove the line selector card. This etched circuit card is approximately $3 / 4^{\prime \prime}$ square and $1 / 8^{\prime \prime}$ thick.
4. Note that on each edge of the selector card there is a red mark, but that the mark is in a different position on the edge.
5. Orient the selector card for the desired voltage range, and press the card into its receptacle.
6. Ensure that the installed fuse matches the range selected.
7. Close the selector door. The proper range should show through the correct one of the four windows.
8. Reconnect the power cord. The TM 506A is ready for use.

## Operating Temperatures

The TM 506A can be operated in an ambient air temperature range of $0^{\circ} \mathrm{C}$ to $+50^{\circ} \mathrm{C}$. Since the TM 506A can be stored in temperatures between $-55^{\circ} \mathrm{C}$ and $+75^{\circ} \mathrm{C}$, allow the instrument's chassis to return to within the temperature operating limits before applying power.

## Cabling

\{CAUTION\}

Remove power cord before attempting cable installation.

For convenience, cabling from the front of the power module to the rear panel may be run through the air intake and cable raceway as shown in Fig. 2-2. To install this cabling, first remove the access panel on the rear of the power module. See Fig. 2-3. Next remove the two bottom panel retainer screws and the bottom panel retainers. Slide the bottom panel out from the rear of the instrument. Pass the cable through the front air intake, across the bottom of the plug-in support rails and out the access panel. Replace the power module bottom cover.

To ensure proper cooling, do not operate the power module with any cover removed.

## Table Top Use

The power module may be operated with the front raised. To raise the front of the instrument extend the front bail as shown in Fig. 2-4.

## Rackmounting Instructions

Cooling. At least 1 -inch clearance is recommended above and below the power module. This is necessary to insure proper cooling.

Fig. 2-2. TM 506A front view.

Fig. 2-3. TM 506A rear panel.

If the rack has positive internal pressure for cooling purposes, the mainframes must have all compartments filled with plug-ins or blank front panels (available from Tektronix, Inc.) must be installed in the unused plug-in openings. If greater internal air flow is desired in a relatively highly pressurized rack, the grill opening at the bottom front of the TM 506A may also be blocked.

Rack Dimensions. The TM 506A, Option 10, is shipped from the factory ready for rack mounting. Figure 2-4 shows major dimensions. Figure 2-5 shows the spring-latch cutout in the stationary section.

## NOTE

The slide tracks supplied with the TM 506A, Option 10, have holes in the stationary sections to accomodate the spring latches. The TM 506A, Option 10, should not be mounted with rack slides that do not have the rack-latch holes.

The TM 506A, Option 10, fits a standard 19 -inch side cabinet, rack or console. Spacing inside the front rails must be at least $173 / 4$ inches. This allows clearance for the stationary section of the slide-out tracks to permit the assembly to slide freely on the slid-out tracks.

The slide-out tracks, with existing hardware supplied, will conveniently mount in any rack with the front and rear rails spaced from $101 / 2$ inches to $241 / 2$ inches.

Mounting the Slide Tracks. Locate the proper rack holes for mounting as shown in Fig. 2-6. Notice that the hole spacing in the racks varies. When installing the slides in the EIA type racks, make certain the slides are attached to the $1 / 2$-inch spaced holes. Figure 2-6 also shows details for determining position of the slides in the rack. Mount the rails using enclosed hardware as shown in Fig. 2-7 and 2-8. Figures 2-8B and C show rail-mounting details for deep and shallow racks. Make sure the stationary sections are horizontally aligned so they are level and parallel with each other.

Fig. 2-4. TM 506A, overall dimensions.

Fig. 2-5. Rack latch hole.

Installing the TM 506A, Option 10, in the Rack Slides. Make certain all plug-ins are removed from the power module. Pull the slide-out track intermediate sections out as far as they will go. See Fig. 2-9. Insert the instrument chassis sections into the intermediate section and push the instrument forward until the instrument chassis section locks into the intermediate section. Now press both buttons protruding from the stop-latch holes in the intermediate sections while pushing the instrument. The instrument can now be pushed into the rack, cabinet, or console. The latches holding the intermediate sections to the stationary sections are automatically operated by the instrument as it is pushed into the rack or cabinet. The quick-release latches automatically engage the rack-latch holes in the stationary sections of the rails as the instrument is pushed fully into the rack.

Removing the Instrument. Remove all plug-ins from power module. Unscrew the two thumb screws at the top of the front panel. Pull the rectangular latches on both sides of the front panel. Using the latches pull the instrument from the enclosure until the slide intermediate sections latch with the instrument sections and the stationary sections. The instrument is firmly held in this position. To completely remove the instrument, press both release-latch buttons visible in the stop-latch holes and carefully slide the instrument from the rack or cabinet.

Rack Adjustments. After installing the instrument in the rack, binding in the rack slides may occur if the slides are not properly adjusted. Slide the instrument from the rack until the front panel is about 10 inches from the front of the rack. Slightly loosen the screws holding the right and left tracks to the front rails. Allow the tracks to seek their normal position. Retighten the screws and check the tracks for smooth operation by sliding the instrument in and out of the rack.

Rack Slide Maintenance. The slide-out tracks do not require lubrication. The dark gray finish on the tracks is a permanent lubricative coating.

## WARNING

During rackmount installation, interchanging the left and right slide-out track assemblies defeats the extension stop (safety latch) feature of the tracks. Equipment could, when extended, come out of the slides and fall from the rack, possibly causing personal injury and equipment damage.

When mounting the supplied slide-out tracks, inspect both assemblies to find the LH (left hand) and RH (right hand) designations to determine correct placement. Install the LH assembly to your left side as you face the front of the rack and install the RH assembly to your right side. Refer to the rackmounting instructions in this manual for complete information.

## Plug-in Installation and Removal

Turn the power module off before inserting or removing the plug-in; otherwise, damage may occur to the plug-in circuitry.

Check to see that the plastic barriers on the interconnecting jack of the selected power module compartment match the cutouts in the plug-in cirucit board edge connector. The right-most compartment is the high power compartment. Align the plug-in chassis with the upper and lower guides (see Fig. 2-10) of the selected compartment. Push the plug-in chassis in and press firmly to seat the circuit board edge connector in the interconnecting jack. Turn the power module on.

Fig. 2-6. Dimensions and positioning of TM 506A, Option 10, in standard rack.

Fig. 2-7. Rackmount slide detail. If the rack has tapped holes, the bar nuts are not required.

Fig. 2-8. Rackmounting slide details.

TO INSTALL:

1. Pull the slide-out track section to the fully extended position.
2. Insert the instrument chassis sections into the slide-out sections.
3. Press the stop latches and push the instrument toward the rack until the latches snap into their holes.
4. Again press the stop latches and push the instrument fully into the rack until the instrument latches on both sides.

TO REMOVE:

1. Press rack release latch bars inward and pull instrument outward until the stop latches snap into the holes.
2. Press stop latches and remove the instrument.

Fig. 2-9. Removing and installing TM 506A in rack slides.

Fig. 2-10. Plug-in installation and removal.

## Family Compatibility

Mechanically, TM 500 plug-in modules are very similar to other Tektronix product families. However, they are not electrically compatible. Therefore, the TM 506A interface has barriers on the mating connectors between pins 6 and 7 to ensure that incompatible plug-ins cannot be inserted. See Fig. 2-11. A compatible module will have a matching slot between pins 6 and 7 of its main circuit board edge connector. This slot and barrier combination is the primary keying assignment.

## Customizing the Interface

The modularity of this instrumentation system provides for many different functions to be performed by the plug-in modules. Specific functions are grouped into families or classes, of which there may be several plug-in module members. For instance, some classes are Power Supplies, Signal Sources, Measurement, and so forth. Each modular member of a functional family will have a second slot peculiar to its family assignment, located in its edge connector. The TM 506A user can select one or more compartments to accept only members of that family, by installing a second barrier in the interface connector to match the module's slot
location. An entire TM 506A can be set up in this manner for specific work functions. For extra barriers, order Tektronix Part No. 214-1593-02.

Jumper wires can be used to further specialize the interface. Compartments can communicate with one another by connecting jumpers on the back side of the interface board, using pins 14 through 28 (both A-side and B-side) of the interconnecting jacks. See the following description of Option 02. Refer to each plug-in module manual for the I/O assignments of each pin at the rear interface. Once interconnections of a specialized nature are made, it is recommended that barriers be installed on the interconnecting jacks to ensure module compatibility with the customized wiring.

## Rear Panel

The rear panel has a connector mounting plate for bnc and multi-pin connector mountings. Customer or factory-installed connectors and wiring (Option 02) can provide external access to the interface. This feature makes the TM 500-Series Modular Instrumentation System very flexible in bench-top or rackmounted systems.

Fig. 2-11. Keying assignments for family functions. One of the many possible sequence combinations.

## Option 02

This option adds six BNC connectors and a 50 -pin connector to the rear panel to allow external access to the interface for external I/O control. These connectors are not prewired. Instead, prepared jumpers, strip pins, coaxial cables, and interconnection jack barriers are included in a kit. This gives the system designer as much flexibility as possible. Refer qualified service personnel to the Maintenance section of this manual for Option 02 installation information.

## Plug-in Retainer Installation

The retainer is used to ensure that an installed plug-in module cannot come out of the power module while it is being moved or transported. Note that plug-in modules cannot be removed or inserted with the retainer installed.

To install the retainer, stand the power module on end. Install the retainer as shown in Fig. 2-10. A T-20 Torx bit is required.

## Turn-On Procedure

After completing the power module preparation and plug-in module installation instructions, install the power cord and connect to the proper power outlet. Some plug-ins
have independent power switches, usually labeled OUTPUT, that control application of mainframe power to the plug-in.

## Repackaging Information

If the Tektronix instrument is shipped to a Tektronix Service Center for service or repair, attach a tag showing owner (with address) and the name of an individual at your firm to contact. Include the complete instrument serial number, option number and a description of the service required.

Save and reuse the package in which your instrument was shipped. If the original packaging is unfit for use or not available, repackage the instrument as follows:

Surround the instrument with polyethylene sheeting to protect the instrument finish. Obtain a carton of corrugated cardboard of the correct carton strength having inside dimensions of no less than six inches more than the instrument dimensions. Cushion the instrument by tightly packing three inches of dunnage or urethane foam between carton and instrument on all sides. Seal the carton with shipping tape or an industrial stapler.

The carton test strength for this instrument is 350 pounds per square inch.
.

## WARNING

THE FOLLOWING SERVICING INSTRUCTIONS ARE FOR USE BY QUALIFIED PERSONNEL ONLY. TO AVOID PERSONAL INJURY, DO NOT PERFORM ANY SERVICING OTHER THAN THAT CONTAINED IN OPERATING INSTRUCTIONS UNLESS YOU ARE QUALIFIED TO DO SO. REFER TO OPERATORS SAFETY SUMMARY AND SERVICE SAFETY SUMMARY PRIOR TO PERFORMING ANY SERVICE.

## MAINTENANCE

## Introduction

This section contains information on preventive maintenance and instrument disassembly.

## Static Sensitive Components

Static discharge can damage any semiconductor component in this instrument.

This instrument contains electrical components that are susceptible to damage from static discharge. See Table 3-1 for relative susceptibility of various classes of semiconductors. Static voltages of 1 kV to 30 kV are common in unprotected environments.

Table 3-1
RELATIVE SUSCEPTIBILITY TO STATIC DISCHARGE DAMAGE

| Semiconductor Classes | Relative <br> Susceptibility <br> Levels |
| :--- | :---: |
| MOS or CMOS microcircuits or <br> discretes, or linear microcircuits <br> with MOS inputs. <br> (Most Sensitive) | 1 |
| ECL | 2 |
| Schottky signal diodes | 3 |
| Schottky TTL | 4 |
| High-frequency bipolar transistors | 5 |
| JFETs | 6 |
| Linear microcircuits | 7 |
| Low-power Schottky TTL | 8 |
| TTL | 9 |

[^0]
## Cleaning

This instrument should be cleaned as often as operating conditions require. Loose dust accumulated on the outside of the instrument can be removed with a soft cloth or small brush. Remove dirt that remains with a soft cloth dampened in a mild detergent and water solution. Do not use abrasive cleaners.

Clean the interior by blowing off the accumulated dust with a dry, low-velocity air (approximately $5 \mathrm{lb} / \mathrm{in}^{2}$ ) or use a soft brush or cloth dampened with a mild detergent and water solution.

Circuit boards and components must be dry before applying power.

## Multipin Connectors

The pin connectors used to connect the wires to the interconnecting pins are clamped to the ends of the wires. To replace damaged multi-pin connectors, remove the old pin connector from the holder. Do this by inserting a scribe between the connector and the holder and prying the connector from the holder. Clamp the replacement connector to the wire. Reinstall the connector in the holder.

If the individual end lead pin connectors are removed from the plastic holder, note the order of the individual wires for correct replacement in the holder. For proper replacement see Fig. 3-1.

## Instrument Disassembly

## WARNING

Use caution when operating this instrument with the side panels removed as dangerous voltages are present.

To remove the top, bottom and side panels, remove the four screws attaching the feet to the rear of the instrument and slide the panels to the rear. See Fig. 3-2. To remove the

interface circuit board, remove the plug-in guide rails shown in Fig. 3-3. Next remove the interface circuit board support by removing the screws shown in Fig. 3-4 and Fig. 3-6. Before removing the main interface circuit board, make certain the connections to the board are either unplugged or unsoldered. Remove the six screws holding the board to the mainframe, and the ten transistor mounting screws on the bottom side. To remove the rear panel, remove the screws shown in Fig. 3-5, and the nut that secures the dc power supply. After these screws are removed, the rear panel may be laid back for easier access to the dc power supply board. After removing the rear panel, the dc power supply circuit board may be removed. Remove the four screws and one nut shown in Fig. 3-6.

## WARNING

Dangerous voltages may be present on the filter capacitors on the dc power supply board for several minutes after line voltage removal.

Fig. 3-1. Orientation and disassembly of multipin connectors.

Fig. 3-2. Outer panel removal.

Fig. 3-3. Guide rail and air baffle removal.

To gain access to the bottom of the dc power supply board, remove the side panel next to the board.

To remove the heat sink:

1. Disconnect the TM 506A from the power source.
2. Disconnect the leads to the high-power series-pass transistors. (The transistors are shown in Fig. 3-7.)
3. Remove the six screws that fasten the heat sink (Fig. $3-8$ ) to the chassis, and lift the heat sink out of the unit.

To remove the transformer assembly:

1. Remove the heat sink.
2. Remove the rear panel.
3. Tag and disconnect all leads.
4. Remove the fastening screws shown in Fig. 3-9, then lift the transformer assembly out of the chassis.

Fig. 3-4. Removal of the interface circuit board support.

Fig. 3-5. Rear panel removal.

Fig. 3-6. Location of screws holding the dc power supply circuit board to the mainframe chassis.

## Circuit Troubleshooting

Troubleshooting the TM 506A is usually very simple. However, if a plug-in is defective, be sure that the problem is not in the TM 506A:

1. Check the power supply fuses. These are located at the rear panel.
2. If no fuses are blown, check the voltages in the TM 506A at the connector where the defective plug-in was used.
3. Turn off the power to the TM 506A and use an ohmmeter to test the series-pass transistor that drives the connector in question.

Fig. 3-7. Series pass transistor locations. The high power compartment series pass transistors Q450 and Q650 are on the right side of the heat sink. Q650 is the upper transistor.

Fig. 3-8. Attaching screws on bottom of mainframe.

Fig. 3-9. Transformer assembly attaching screws.

## OPTIONS

## Introduction

Option 02 provides rear interface connections at the rear panel and Option 10 provides rack mounting capabilities. Information on Option 02 is found below. Information on Option 10 is provided in Section 2 of this manual, and at the end of the Replaceable Mechanical Parts List.

## Option 02

This option adds 25 -mil square pin connectors to the rear of the interconnecting jacks at all pins from 14A and $B$ to pins 28A and $B$. This option also adds six bnc connectors and one 50 -pin connector to the rear panel. These connectors are not prewired. Prepared jumpers, coaxial cables, square pins, and interconnection jack barriers are included in the kit.

## System Design Directions

1. Plan the plug-in location in the mainframe based on operator convenience as well as interface connections.
2. Plan the wiring between interconnecting jacks and to the rear panel connectors before starting assembly. A mating rear panel 50 -pin connector and cover are provided for external cabling.

## NOTE

There are no pin assignments for the rear panel connectors, due to the great variety of possible connections.

When high frequency or fast digital signals are involved, plan the wiring to minimize crosstalk. Make allowance for possible auxiliary ground connections.

The 50-pin rear panel connector may be easier to connect if it is removed from the rear panel and remounted after connections are made. Remove the top rear cabinet piece for ease of access.

If more than 50 pins are needed, an AMP HD-22 series connector with 104 pins may be mounted in the same cut out. It is suggested that these parts be obtained directly from AMP Inc., Harrisburg, PA or their distributors. For further application information, contact Tektronix TM 500 Marketing Group.
3. Pin assignments for individual plug-ins will be found in the appropriate instruction manual.
4. Install an interconnection jack barrier at the appropriate location on the interconnection jack. Refer to operating instructions for keying assignments for family functions.
5. Select and install the wires (hook-up or coaxial cable) following the guidelines in the Wire Use part of these instructions.
6. Wires or cables which may be at large potential differences should be dressed or bundled so as to avoid contact. Keep all interface wiring away from the power module primary line wiring.

Maximum input voltage is $\leqslant 60 \mathrm{Vdc}$ or $\leqslant 42.4 \mathrm{Vdc}$ peak-to-peak. Limit input power to $\leqslant 150 \mathrm{~W}$ total for Option 02.

## Wire Use

1. Hook up wire with square pin receptacles on both ends. These may be used for low frequency or dc circuits where impedance levels and crosstalk are not a problem. The wire is supplied for connection between compartments (adjacent or nonadjacent) or between a compartment and the rear panel. For connection to the rear panel, cut to length then tin and solder the end going to the rear panel connector.
2. Coaxial wire with square pin receptacles on both
ends. These are used for connections which require shielding or which must maintain a $50 \Omega$ characteristic impedance. The outer conductor should be connected to either chassis ground or circuit ground. Plug-in lines which require coaxial leads usually have a specified ground pin assignment. If necessary, establish auxiliary ground connections at the appropriate wire ends. The coaxial wire is supplied for connection between compartments (adjacent or nonadjacent) or between a compartment and the rear panel. For connection to the rear panel, cut to length then tin and solder the end going to the rear panel connector.

# REPLACEABLE ELECTRICAL PARTS 

## PARTS ORDERING INFORMATION

Replacement parts are available from or through your local Tektronix, Inc. Field Office or representative

Changes to Tektronix instruments are sometimes made to accommodate improved components as they become available, and to give you the benefit of the latest circuit improvements developed in our engineering department. It is therefore important, when ordering parts, to include the following information in your order: Part number, instrument type or number, serial number, and modification number if applicable.

If a part you have ordered has been replaced with a new or improved part, your local Tektronix, Inc. Field Office or representative will contact you concerning any change in part number.

Change information, if any, is located at the rear of this manual.

## LIST OF ASSEMBLIES

A list of assemblies can be found at the beginning of the Electrical Parts List. The assemblies are listed in numerical order. When the complete component number of a part is known, this list will identify the assembly in which the part is located.

## CROSS INDEX-MFR. CODE NUMBER TO MANUFACTURER

The Mfr. Code Number to Manufacturer index for the Electrical Parts List is located immediately after this page. The Cross Index provides codes, names and addresses of manufacturers of components listed in the Electrical Parts List.

## ABBREVIATIONS

Abbreviations conform to American National Standard Y1.1.

## COMPONENT NUMBER (column one of the Electrical Parts List)

A numbering method has been used to identify assemblies, subassemblies and parts. Examples of this numbering method and typical expansions are illustrated by the following:

Read: Resistor 1234 of Assembly 23

Read: Resistor 1234 of Subassembly 2 of Assembly 23

Only the circuit number will appear on the diagrams and circuit board illustrations. Each diagram and circuit board illustration is clearly marked with the assembly number. Assembly numbers are also marked on the mechanical exploded views located in the Mechanical Parts List. The component number is obtained by adding the assembly number prefix to the circuit number.

The Electrical Parts List is divided and arranged by assemblies in numerical sequence (e.g., assembly A1 with its subassemblies and parts, precedes assembly A2 with its subassemblies and parts).

Chassis-mounted parts have no assembly number prefix and are located at the end of the Electrical Parts List.

## TEKTRONIX PART NO. (column two of the Electrical Parts List)

Indicates part number to be used when ordering replacement part from Tektronix.

## SERIAL/MODEL NO. (columns three and four of the Electrical Parts List)

Column three (3) indicates the serial number at which the part was first used. Column four (4) indicates the serial number at which the part was removed. No serial number entered indicates part is good for all serial numbers.

## NAME \& DESCRIPTION (column five of the Electrical Parts List)

In the Parts List, an Item Name is separated from the description by a colon (:). Because of space limitations, an Item Name may sometimes appear as incomplete. For further Item Name identification, the U.S. Federal Cataloging Handbook H6-1 can be utilized where possible.

## MFR. CODE (column six of the Electrical Parts List)

Indicates the code number of the actual manufacturer of the part. (Code to name and address cross reference can be found immediately after this page.)

## MFR. PART NUMBER (column seven of the Electrical Parts List)

Indicates actual manufacturers part number.

## DIAGRAMS AND CIRCUIT BOARD ILLUSTRATIONS

## Symbols

Graphic symbols and class designation letters are based on ANSI Standard Y32.2-1975.

Logic symbology is based on ANSI Y32.14-1973 in terms of positive logic. Logic symbols depict the logic function performed and may differ from the manufacturer's data.

The overline on a signal name indicates that the signal performs its intended function when it is in the low state.

Abbreviations are based on ANSI Y1.1-1972.

Other ANSI standards that are used in the preparation of diagrams by Tektronix, Inc. are:

Y14.15, 1966 Drafting Practices.
Y14.2, 1973 Line Conventions and Lettering.
Y10.5, 1968 Letter Symbols for Quantities Used in Electrical Science and Electrical Engineering.
American National Standard Institute 1430 Broadway
New York, New York 10018

## Component Values

Electrical components shown on the diagrams are in the following units unless noted otherwise:

Capacitors $=$ Values one or greater are in picofarads (pF). Values less than one are in microfarads ( $\mu \mathrm{F}$ ).
Resistors $=$ Ohms ( $\Omega$ ).

## The information and special symbols below may appear in this manual.

## Assembly Numbers and Grid Coordinates

Each assembly in the instrument is assigned an assembly number (e.g., A20). The assembly number appears on the circuit board outline on the diagram, in the title for the circuit board component location illustration, and in the lookup table for the schematic diagram and corresponding component locator illustration. The Replaceable Electrical Parts list is arranged by assemblies in numerical sequence; the components are listed by component number *(see following illustration for constructing a component number).

The schematic diagram and circuit board component location illustration have grids. A lookup table with the grid coordinates is provided for ease of locating the component. Only the components illustrated on the facing diagram are listed in the lookup table. When more than one schematic diagram is used to illustrate the circuitry on a circuit board, the circuit board illustration may only appear opposite the first diagram on which it was illustrated; the lookup table will list the diagram number of other diagrams that the circuitry of the circuit board appears on.

## REPLACEABLE <br> MECHANICAL PARTS

## PARTS ORDERING INFORMATION

Replacement parts are available from or through your local Tektronix, Inc. Field Office or representative.

Changes to Tektronix instruments are sometimes made to accommodate improved components as they become available, and to give you the benefit of the latest circuit improvements developed in our engineering department. It is therefore important, when ordering parts, to include the following information in your order: Part number, instrument type or number, serial number, and modification number if applicable.

If a part you have ordered has been replaced with a new or improved part, your local Tektronix, Inc. Field Office or representative will contact you concerning any change in part number.

Change information, if any, is located at the rear of this manual.

## ITEM NAME

In the Parts List, an item Name is separated from the description by a colon(:). Because of space limitations, an Item Name may sometimes appear as incomplete. For further Item Name identification, the U.S. Federal Cataloging Handbook H6-1 can be utilized where possible.

## FIGURE AND INDEX NUMBERS

Items in this section are referenced by figure and index numbers to the illustrations.

## INDENTATION SYSTEM

This mechanical parts list is indented to indicate item relationships. Following is an example of the indentation system used in the description column.

## 12345 <br> Name \& Description

Assembly and/or Component
Attaching parts for Assembly and/or Component

## END ATTACHING PARTS

Detail Part of Assembly and/or Component Attaching parts for Detail Part

END ATTACHING PARTS
Parts of Detail Part
Attaching parts for Parts of Detail Part
END ATTACHING PARTS
Attaching Parts always appear in the same indentation as the item it mounts, while the detail parts are indented to the right. Indented items are part of, and included with, the next higher indentation.

Attaching parts must be purchased separately, unless otherwise specified.

## MANUAL CHANGE INFORMATION

At Tektronix, we continually strive to keep up with latest electronic developments by adding circuit and component improvements to our instruments as soon as they are developed and tested.

Sometimes, due to printing and shipping requirements, we can't get these changes immediately into printed manuals. Hence, your manual may contain new change information on following pages.

A single change may affect several sections. Since the change information sheets are carried in the manual until all changes are permanently entered, some duplication may occur. If no such change pages appear following this page, your manual is correct as printed.

# Tektronix. <br> COMMITTED TO EXCELLENCE 

MANUAL CHANGE INFORMATION
Date: $\qquad$ June 1.1988

Change Reference:<br>$\qquad$

Product: TM 506A Power Module
DESCRIPTION

Effective for all serial numbers, Please make the following changes:
