## INSTRUMENT SERIAL NUMBERS

Each instrument has a serial number on a panel insert, tag, or stamped on the chassis. The first number or letter designates the country of manufacture. The last five digits of the serial number are assigned sequentially and are unique to each instrument. Those manufactured in the United States have six unique digits. The country of manufacture is identified as follows:

| B000000 | Tektronix, Inc., Beaverton, Oregon, USA |
| :--- | :--- |
| 100000 | Tektronix Guernsey, Ltd., Channel Islands |
| 200000 | Tektronix United Kingdom, Ltd., London |
| 300000 | Sony/Tektronix, Japan |
| 700000 | Tektronix Holland, NV, Heerenveen, |
|  | The Netherlands |

# 7A17 INSTRUCTION MANUAL 

## SPECIFICATION

## General

The 7A17 is a utility plug-in designed for use with Tektronix 7000 -series oscilloscopes. This plug-in provides 50 -ohm, 50-millivolt/division access to either the vertical or horizontal deflection system in the mainframe. It also provides interfacing to the mainframe power supplies, readout encoding circuits, and other functions that allow custom circuit design to meet specific needs.

## Electrical Characteristics

Deflection Factor:
50 millivolts/division with Gain adjusted internally.

Frequency Response (Mainframe dependent):
7400-50 megahertz; 7500-75 megahertz; 7700-150 megahertz; 7900-greater than 150 megahertz.

Input Impedance:
50 ohms plus or minus $10 \%$.

## POSITION Range:

At least +10 divisions to at least -10 divisions from graticule center.

Maximum Input Voltage:
5 volts RMS

## Environmental Characteristics

Refer to the 7000-series oscilloscope mainframe manual.

## OPERATING INSTRUCTIONS

## General

The 7A17 operates with any 7000-series oscilloscope and is ready for use as it is received. It can be installed in any compartment of the 7000 -series oscilloscope. To
install, align the upper and lower rails of the 7A17 with the plug-in compartment tracks and fully insert it (the plug-in panel must be flush with the oscilloscope panel). To remove, pull the release latch to disengage the 7A17 from the oscilloscope.

## Controls and Connectors

POSITION Positions the display.

INPUT BNC connector provides a means for connecting a signal.

## Input Coupling

The 7A17 INPUT is directly coupled into a 50 -ohm impedance. However, the input may be designed to accept any type of signal. Refer to the Applications section for suggestions.

## Deflection Factor

This plug-in has a basic deflection factor of 50 $\mathrm{mV} / \mathrm{div}$ when the internal Gain control is properly adjusted. Greater than $10 \mathrm{mV} / \mathrm{div}$ at reduced bandwidth may be achieved by adjusting the Gain control. Other deflection factors may be achieved by using the solder pads provided in the plug-in, and custom-designing the circuit. Refer to the Applications section for suggestions.

## Readout Encoding

The 7A17 is not factory equipped with readout. However, access is provided so that readout encoding resistors can be connected. Refer to the Applications section for suggestions.

## Polarity

The polarity of the displayed signal may be inverted by moving the straps from +UP (as marked on the circuit board) to the solder pads marked INV.

## CIRCUIT OPERATION

The signal applied to the INPUT connector is direct coupled to paraphase amplifier Q110, Q210. Positioning is achieved by varying the DC level at the base of Q210. Gain of the paraphase amplifier ( $\mathrm{Q} 110, \mathrm{Q} 210$ ) is
set to approximately one by R211. Polarity of the displayed signal may be inverted by moving the shorting straps to the INV position. The output of the paraphase amplifier is connected to common emitter differential amplifier Q125, Q225 and common base differential amplifier Q120, Q220. These amplifiers provide trigger output and signal outputs to the oscilloscope mainframe via the interface connectors.

## MAINTENANCE

## General

This portion of the manual contains information concerning preventive maintenance, corrective maintenance, and troubleshooting the 7A17. Further information relating to general maintenance can be found in the 7000 -series instruction manual.

## Cleaning

To improve reliability and to avoid possible thermal and electrical problems, it is recommended that the 7 A 17 be cleaned at periodic intervals, as well as before calibration.

Loose dust may be removed with a soft cloth or a dry brush. Hardened dirt may be removed with a cotton-tipped swab or cloth, dampened with a mild detergent and water solution, then carefully rinsed and dried.

## Troubleshooting

Several troubleshooting aids for the 7A17 are given on one foldout page located at the rear of the manual. This page includes: Schematic diagrams, showing important voltages, component values, and circuit numbers; board pictures showing physical locations of the components; and semiconductor basing diagrams. For best results, use these aids in conjunction with the Circuit Operation and Calibration procedure.

Refer to the 7000-series mainframe manual for general troubleshooting information. (i.e. semiconductor care, color coding, etc.).

## Corrective Maintenance

Standard Replacement Parts. All electrical and mechanical replacement parts for the 7A17 can be obtained through your local field office or representative. However, many of the electronic parts can be obtained locally in less time than is required to order them from Tektronix, Inc. Before purchasing or ordering replacement parts, check the parts list for value, rating, tolerance, and description.

Special Parts. In addition to the standard electronic components, some special parts are used in the 7A17. These parts are manufactured or selected by Tektronix, Inc. in accordance with our specifications. These special parts are indicated in the parts list by an asterisk preceding the part number. Order all special parts directly from your local Tektronix Field Office or representative

Ordering Parts. When ordering replacement parts from Tektronix, Inc., include the instrument Type, instrument Serial Number, a description of the part (if electrical, include circuit number), and the Tektronix Part Number.

Soldering Techniques. Care should be taken when soldering to prevent damage due to excess heat. A small wattage soldering iron ( 15 to 50 watts) should be used. Apply heat directly to the junction to be soldered. Use only enough heat to form a good bond. Heat sink components when necessary.

## Repackaging for Shipment

If the Tektronix instrument is to be shipped to a Tektronix Service Center for service or repair, attach a tag showing: owner (with address) and the name of an individual at your firm that can be contacted, complete instrument serial number and a description of the service required.

Save and re-use the package in which your instrument was shipped. If the original packaging is unfit for use or not available, repackage the instrument as follows:

Surround the instrument with polyethylene sheeting to protect the finish of the instrument. Obtain a carton of corrugated cardboard of the correct carton strength and having inside dimensions of no less than six inches more than the instrument dimensions. Cushion the instrument by tightly packing three inches of dunnage or urethane foam between carton and instrument, on all sides. Seal carton with shipping tape or industrial stapler.

The carton test strength for your instrument is 200 pounds.

## CALIBRATION

## Gain

Install the 7A17 in any 7000-series oscilloscope mainframe. Apply a $1 \mathrm{kHz}, 0.4$ volt square-wave from the oscilloscope CALIBRATOR. Center the display and adjust the Gain potentiometer (located on the circuit board) for a display of eight divisions.

NOTE
Observe proper termination of CALIBRATOR output when applying voltage to the $7 A 1750 \Omega$ input.

## APPLICATIONS

## General

This section provides suggestions for possible modifications to the 7A17. The 7A17 may be modified to suit a particular need by using the areas provided for circuit construction. Power supply and readout connections are readily available; see Fig. 2 for their locations. The front sub-panel of the 7A17 is pre-punched with various size and shape holes to allow easy mounting of switches, indicators, etc.

Power supply limitations are given in Table 1. It is recommended that circuitry added to the 7A17 not exceed these limitations.

TABLE 1
POWER SUPPLY LOAD LIMITS

Supply Volts

$+15 \mathrm{~V}$
-15 V
$+50 \mathrm{~V}$
$-50 \mathrm{~V}$
*Maximum Limit
500 mA
500 mA
500 mA
100 mA
100 mA
*These maximums cannot occur simultaneously! The total power dissipation must not exceed 16.5 watts.

Fig. 2. 7A17 showing areas for circuit construction and pre-punched front sub-panel.

## HIGH IMPEDANCE AMPLIFIER

This field effect transistor (FET) amplifier can be connected to the input of the 7A17 to increase the stability and raise the input impedance from 50 ohms to over one megohm depending on the value of R1. (It is not recommended that R1 exceed five or ten megohms due to potential leakage problems.)

The optional limiter circuit, consisting of CR1a and CR1b, should be used when there is a possibility of exceeding $\pm 15$ volts at the input of the FET amplifier. This circuit will avoid possible damage to the FET.

| R5 | $390 \Omega$ | $1 / 4 \mathrm{~W}$ | $5 \%$ |
| :--- | :--- | :--- | :--- |
| R6 | $910 \Omega$ | $1 / 4 \mathrm{~W}$ | $5 \%$ |

| R2 | $470 \mathrm{~K} \Omega$ | $1 / 4 \mathrm{~W}$ | $10 \%$ |  | from Tektronix, Inc., order part |
| R3 | $560 \Omega$ | $1 / 4 \mathrm{~W}$ | $5 \%$ |  | number 152-0321-00. |

*May be selected to suit input impedance requirements.
**Optional

Fig. 3. FET Amplifier.

## ATTENUATORS <br> (Use with FET Amplifier)

In some cases where the sensitivity of the 7A17 is too great, attenuators of the type shown in Fig. 4 may be added. These are high impedance attenuators and should be used with a high input impedance amplifier, refer to the FET Amplifier in this section.

C2 is a variable capacitor used to normalize the Input to approximately 10 pF . For these calculations, C 2 is assumed to be 10 pF .

## Formulas:

Attenuation Ratio $\mathrm{V}_{\mathrm{r}}=\mathrm{V}_{0} / \mathrm{V}_{\mathrm{i}}$
$R_{\text {fet }}=$ input resistance of the amplifier.
$\mathrm{R}_{\text {in }}=$ desired input resistance at the INPUT connector.

$$
R_{2}^{\prime}=R_{\text {in }} \times V_{r} R_{2} \text { paralleled with } R_{\text {fet }}
$$

$R_{1}=R_{\text {in }}-R_{2}{ }^{\prime}$
$R_{2}=\frac{R_{2}{ }^{\prime} R_{\text {fet }}}{R_{f e t}-R_{2}{ }^{\prime}}$
$C_{1}=\frac{R_{2}^{\prime} C_{2}}{R_{1}}$

Example: A deflection factor of $200 \mathrm{mV} / \mathrm{div}$ with $\mathrm{R}_{\mathrm{in}}=1$ megohm is desired. The FET amplifier has an input resistance $=1$ megohm $=R_{\text {fet }}$

$$
V_{r}=V_{o} / V_{i}=\frac{50 \mathrm{mV} / \mathrm{div}}{200 \mathrm{mV} / \mathrm{Div}}=0.25
$$

$$
\mathrm{R}_{2}^{\prime}=1 \text { megohm } \times 0.25=250 \text { kilohm }
$$

$$
\mathrm{R}_{1}=1 \text { megohm }-250 \text { kilohm }=750 \text { kilohm }
$$

$$
R_{2}=\frac{250 \text { kilohm } \times 1 \text { megohm }}{1 \text { megohm }-250 \text { kilohm }}=333 \text { kilohm }
$$

$$
\mathrm{C}_{1}=\frac{250 \text { kilohm } \times 10 \text { picofarads }}{750 \text { kilohm }}=3.3 \text { picofarads }
$$

Normalizing Connect a 1 kHz square wave from the oscilloscope CALIBRATOR. Adjust the output of the CALIBRATOR for a display of four to six vertical divisions. Adjust C2 for square leading edge and flat top.

Gain

Readjust, if necessary, the 7A17 Gain control for proper sensitivity.

Fig. 4. High Frequency Attenuators.

## READOUT

Each of the oscilloscopes four plug-in compartments are allotted two word locations located at the top and bottom of the CRT screen (see Fig. 5). Each word location can be encoded to write up to ten characters. For each of the ten spaces available in a word location there is a corresponding timeslot (TS) pulse. The timeslot pulses interrogate the readout encoding resistors in the plug-ins. The resulting information is returned to the oscilloscope readout system as various row and column currents. These row and column currents select the characters or operations from the matrix shown in Fig. 7. For example: to obtain the letter " $A$ " there must be 0.4 mA of row current and 0.3 mA of column current.

Fig. 5. Readout Word Locations and Timeslot Locations.

Each word location has its own row and column return lines. The top word locations have a row return line located at B37 of the plug-in interface connector and a column return line located at A37. The bottom word locations have a row return line at B38 and a column return line at A38.

The timeslot pulses are always -15 volts in amplitude. Therefore the current flowing from the timeslot lines through the plug-in encoding resistors into the row and column return lines is a direct result of the value of the encoding resistors as given by Ohm's law. For example: In order to place the letter " $A$ " at timeslot location 3 of the top word location (circled in Fig. 5), a 37.4 kilohm resistor ( -15 volts $/ 0.4 \mathrm{~mA}$ ) must be placed between TS-3 and the row return line B37 and a 50 kilohm resistor ( -15 volts $/ 0.3 \mathrm{~mA}$ ) between TS-3 and column return line A37. Refer to Table 2 for interface pin connections.

The diagram for the above example is shown in Fig. 6.

Fig. 6. Encoding configuration for letter " $A$ ".
To assure that encoding errors cannot occur when the encoding load is heavy, a diode should be placed in series with those encoding resistors that allow 0.6 mA or more current to flow into the row or column return lines. This means that when calculating the values for the encoding resistors the forward voltage drop ( $\mathrm{V}_{\mathrm{f}}$ ) of the diode must be taken into account; i.e., to obtain 0.9 mA using a silicon diode, the typical value of the encoding resistor would be -15 volts $\mathrm{V}_{\mathrm{f}} / 0.9 \mathrm{~mA}=15$ volts -0.6 volts $/ 0.9 \mathrm{~mA} \approx 16.2$ kilohms.

Operational address

Fig. 7. Readout Matrix.

The following table indicates the typical resistor values required to encode specific currents. Resistors may be rated as low as $1 / 8$ watt.

| Required <br> Current | Resistor <br> Value | Tolerance |
| :---: | :---: | :---: |
| 0.1 mA | $150 \mathrm{k} \Omega$ | $5 \%$ |
| 0.2 mA | $75 \mathrm{k} \Omega$ | $5 \%$ |
| 0.3 mA | $50 \mathrm{k} \Omega$ | $5 \%$ |
| 0.4 mA | $37.4 \mathrm{k} \Omega$ | $1 \%$ |
| 0.5 mA | $30.1 \mathrm{k} \Omega$ | $1 \%$ |
| 0.6 mA | $24.3 \mathrm{k} \Omega$ | $1 \%$ |
| ${ }^{*} 0.7 \mathrm{~mA}$ | $20.5 \mathrm{k} \Omega$ | $1 \%$ |
| ${ }^{*} 0.8 \mathrm{~mA}$ | $18.2 \mathrm{k} \Omega$ | $1 \%$ |
| ${ }^{*} 0.9 \mathrm{~mA}$ | $16.2 \mathrm{k} \Omega$ | $1 \%$ |
| ${ }^{*} \geqslant 1.0 \mathrm{~mA}$ | $12 \mathrm{k} \Omega$ | $5 \%$ |
| ing a 1 N 4152 silicon diode |  |  |

Example: "TEST 1" is to be written on the CRT screen. This word is six characters long (including a
space). The following figure shows a possible timeslot assignment.

| Timeslot | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Character |  |  | T | E | S | T | space | 1 |  |  |

Timeslots 1, 2, 9 and 10 do not require encoding resistors. Typical resistor values for encoding are given in the following chart.

The circuit for "TEST 1" is shown in Fig. 8.

| Timeslot <br> Location | Character | Row <br> Encoding <br> Resistor | Column <br> Encoding <br> Resistor |
| :---: | :---: | :---: | :---: |
| 3 | T | $50 \mathrm{k} \Omega$ | $16.2 \mathrm{k} \Omega$ |
| 4 | E | $37.4 \mathrm{k} \Omega$ | $12 \mathrm{k} \Omega$ |
| 5 | S | $37.4 \mathrm{k} \Omega$ | $150 \mathrm{k} \Omega$ |
| 6 | T | $50 \mathrm{k} \Omega$ | $16.2 \mathrm{k} \Omega$ |
| 7 | SPACE | $16.2 \mathrm{k} \Omega$ | - |
| 8 | 1 | - | $75 \mathrm{k} \Omega$ |

Fig. 8. Encoding information for "TEST 1".

## BANDWIDTH LIMITER

For low frequency applications, high frequency noise problems can be reduced by restricting the bandwidth of the 7A17. For example, when displaying a lowfrequency signal, limiting the high frequency response in many cases will considerably reduce high frequency noise without distorting the desired signal.

The filter shown in Fig. 9 is to be connected in series with the Signal output lines \{A-11 and B-11 on the connector). Small notches on the conductive "runs" leading to A-11 and B-11 are provided as points where the Signal output lines may be cut to insert the filter.

This filter may be designed using the following formula where $F_{C}$ is the -3 dB frequency in Hertz (when working into an impedance of 50 ohms each side to ground). $L$ is given in Henrys; $C$ is given in Farads; and $R$ is given in Ohms.

The readout matrix (Fig. 7) contains both characters and operations. The operations are marked with an asterisk $\left({ }^{*}\right)$ and are always encoded during timeslot 1. Encoding these operations causes pre-determined characters or decimals to appear in or between pre-determined timeslot locations. For example: encoding "ADD TWO ZEROS" during timeslot 1 will cause zeros to be displayed in timeslot locations 5 and 6; by encoding "REDUCE PREFIX" during timeslot 1, the prefix that was previously encoded for timeslot 7 will be changed; (i.e., milli $(\mathrm{m})$ to micro $(\mu)$ ).

Decimals encoded during timeslot 1 appear between timeslot locations therefore do not require the use of another timeslot location. Example: Encoding "DECIMAL POINT LOCATION \#4' during timeslot 1 would cause a decimal to appear between timeslot 4 and timeslot 5 .

Encoding the "IDENTIFY" operation during timeslot 1 will cause the entire readout to change to the word IDENTIFY.

For further information concerning the readout refer to the manual of any 7000 series mainframe that contains a readout.

$$
\mathrm{L}=\frac{50}{\pi \mathrm{~F}_{\mathrm{c}}} \quad \mathrm{C}=\frac{\mathrm{L}}{\pi \mathrm{~F}_{\mathrm{c}} \times 200} \quad \mathrm{R}=\frac{2 \pi \mathrm{~F}_{\mathrm{c}} \mathrm{~L}}{0.5}
$$

EXAMPLE: When $F_{c}$ equals 5 megahertz. $L=3.20 \mu \mathrm{H}$, $C=320 \mathrm{pF}$, and $R=200$ ohms.

Fig. 9. Bandwidth Limiter.

# REPLACEABLE ELECTRICAL PARTS 

## PARTS ORDERING INFORMATION

#### Abstract

Replacement parts are available from or through your local Tektronix, Inc. Field Office or representative.

Changes to Tektronix instruments are sometimes made to accommodate improved components as they become available, and to give you the benefit of the latest circuit improvements developed in our engineering department. It is therefore important, when ordering parts, to include the following information in your order: Part number, instrument type or number, serial number, and modification number if applicable.

If a part you have ordered has been replaced with a new or improved part, your local Tektronix. Inc. Field Office or representative will contact you concerning any change in part number.

Change information, if any, is located at the rear of this manual.

## ITEM NAME

In the Parts List, an Item Name is separated from the description by a colon (:). Because of space limitations, an Item Name may sometimes appear as incomplete. For further Item Name identification, the U.S. Federal Cataloging Handbook H6-1 can be utilized where possible.

## *C211 LOCATED ON BACK OF BOARD

## REPLACEABLE MECHANICAL PARTS

## PARTS ORDERING INFORMATION

Replacement parts are available from or through your local Tektronix, Inc. Field Office or representative.

Changes to Tektronix instruments are sometimes made to accommodate improved components as they become available, and to give you the benefit of the latest circuit improvements developed in our engineering department. It is therefore important, when ordering parts, to include the following information in your order: Part number, instrument type or number, serial number, and modification number if applicable.

If a part you have ordered has been replaced with a new or improved part, your local Tektronix, Inc. Field Office or representative will contact you concerning any change in part number.

Change information, if any, is located at the rear of this manual.

## ITEM NAME

In the-Parts List, an Item Name is separated from the description by a colon (:). Because of space limitations, an Item Name may sometimes appear as incomplete. For further Item Name identification, the U.S. Federal Cataloging Handbook H6-1 can be utilized where possible.

## FIGURE AND INDEX NUMBERS

Items in this section are referenced by figure and index numbers to the illustrations.

## INDENTATION SYSTEM

This mechanical parts list is indented to indicate item relationships. Following is an example of the indentation system used in the description column.

12345<br>Name \& Description

Assembly and/or Component
Attaching parts for Assembly and/or Component
Detail Part of Assembly and/or Component
Attaching parts for Detail Part
. . . • - . -

Parts of Detail Part
Attaching parts for Parts of Detail Part
. . . • . . .

Attaching Parts always appear in the same indentation as the item it mounts, while the detail parts are indented to the right. Indented items are part of, and included with, the next higher indentation. The separation symbol --- --- indicates the end of attaching parts.

Attaching parts must be purchased separately, unless otherwise specified.

## MANUAL CHANGE INFORMATION

At Tektronix, we continually strive to keep up with latest electronic developments by adding circuit and component improvements to our instruments as soon as they are developed and tested.

Sometimes, due to printing and shipping requirements, we can't get these changes immediately into printed manuals. Hence, your manual may contain new change information on following pages.

A single change may affect several sections. Since the change information sheets are carried in the manual until all changes are permanently entered, some duplication may occur. If no such change pages appear following this page, your manual is correct as printed.
