

## SPECIFICATIONS (All Options)

### Description

The P6133 is a 150 MHz, 10X, 2-meter, passive voltage probe designed specifically for use with the TEKTRONIX 2400 Series oscilloscopes having bandwidths less than or equal to 150 MHz. The P6133 comes standard with a 2 meter length (1.3 meter and 3 meter lengths available) and the Tektronix *subminiature*-size probe tip/hybrid assembly which is fully compatible with the Tektronix *subminiature* family of accessories. The new *compact* series probe tip/hybrid assembly comes standard on the P6133 Option 25 (only available in a 1.3 meter length). The *compact* size probe tip/hybrid assembly is slightly larger in diameter than the *subminiature*, which offers a greater durability and ruggedness in those environments and applications where required. The *compact* tip is not compatible with the *subminiature* series and is supplied with complementing accessories. Optional accessories are available for both sizes of tips. The *subminiature* and *compact* probe tip/hybrid assemblies may be converted to the Tektronix *miniature* series probe tip by using the *subminiature/compact* to *miniature* probe tip adapter (see optional accessories sections for each probe).

### Electrical Characteristics

(Probe Installed On 2400 Series Oscilloscopes Of  $\leq 150$  MHz)

Attenuational (System): 10X  $\pm 1\%$  at dc.

Input Resistance (System): 10 M $\Omega$   $\pm 1\%$  at dc. (See Figure 1.)

Input Capacitance (See Figure 1.):

1.3 meter:  $\approx 11.4$  pF

2 meter:  $\approx 12.7$  pF

3 meter:  $\approx 14.5$  pF

Compensation Range: 10 pF to 25 pF.

Signal Delay: Delay difference between any two probes is  $< 200$  ps.

Maximum System Bandwidth (-3 dB):

1.3 meter: 150 MHz

2 meter: 150 MHz

3 meter: 120 MHz

Maximum Nondestructive Input Voltage:

500 V (dc + peak ac) to 1.3 MHz. (See Figure 2 for voltage derating curve.)

### Environmental Characteristics

Temperature Range (Operating): -15°C to 75°C (+5°F to 167°F).

Temperature Range (Nonoperating): -62°C to 85°C (-80°F to 185°F).

Humidity:

Five cycles (120 hr) at 95% to 97% relative humidity. Per Tek Standard 062-2847-00, Class 3.

Ref to MIL-E-16400F, paragraph 4.5.9 through 4.5.9.5.1, class 4.

### Physical Characteristics

Net Weight (Includes Accessories): 1.3 meter, 108 g (3.8 oz); .2 meter, 129 g (4.8 oz); 3 meter, 159 g (5.9 oz).

Probe Cable Length: 1.3 m (4.3 ft), 2 meter (6.6ft), 3 meter (9.8 ft).

### Safety

To avoid explosion, do not operate this product in an explosive atmosphere unless it has been specifically certified for such operation.

The P6133 is UL listed.

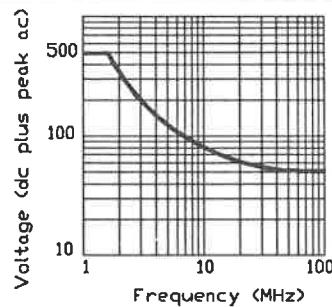

Figure 2. Typical Voltage Derating.

## OPERATING CONSIDERATIONS

**Probe Compensation.** Due to variations in oscilloscope input characteristics, probe low-frequency compensation should be checked and adjusted after moving the probe from one input to another. To adjust low-frequency compensation, apply a 1 kHz square-wave signal (such as an oscilloscope calibrator output) to the probe tip. Using a non-conductive low-reactance alignment tool, adjust the probe's compensation capacitor through the hole in the compensation box to obtain the squarest waveform at front corner.

**Inductive Effects of Probe Grounding.** Ground Lead inductance can significantly reduce the performance of a probe. As shown

in the model (Figure 3), the ground lead inserts a series inductance into the signal path forming a series-resonant circuit consisting of  $C_{in}$  of the probe and ground lead inductance, with only  $R_{source}$  as damping. This forms a resonant circuit with  $f_0 = 1 + (2\pi \sqrt{LC})$ . A six-inch ground lead has  $\sim 150$  nH of inductance causing an  $f_0$  of  $\sim 130$  MHz, which is within the frequency response of the instrument. This greatly degrades risetime, bandwidth, and transient accuracy (Figure 4). For best results, make sure that the ground lead inductance is at a minimum. Three methods for doing so are described in figure 5.

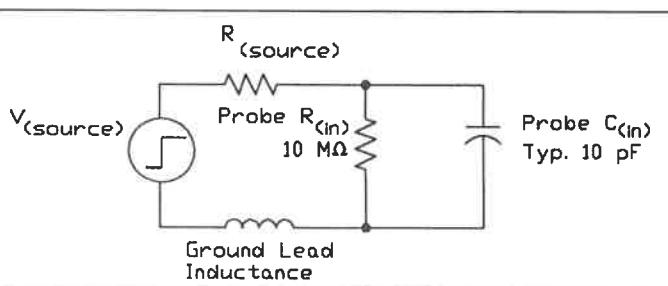

Figure 3. Circuit Model: Test Point and Probe Input.

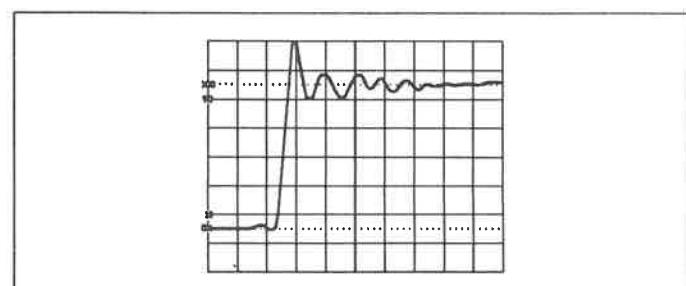

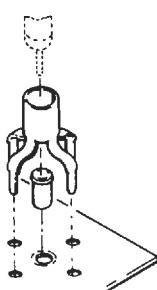

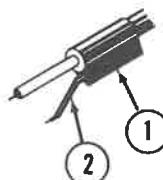

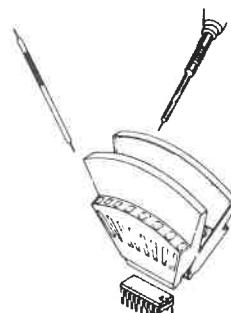

Figure 4. Typical Step Response With a 6" Ground Lead.

ECB to Probe-Tip Adapters provide high quality connection test points when installed on circuit boards. The ribbed-plastic tip shell on the probe must be removed. The probe will then plug into the test point directly. Adapters are available in packages of 100, for both the compact probe tip and the subminiature probe tip (see "Replaceable Parts").

The Low-Inductance Lead provided with all Tek P6133 probes allow for a substantial reduction of ground-lead inductance ( $\sim 32$  nH instead of  $150$  nH). To use, unscrew and remove the ribbed tip shell and slide off the ground collar with ground lead. Slip on the low-inductance ground lead collar (1) and reinstall the ribbed plastic tip cover. Install the low-inductance lead (2) from the accessory pack.

The Tektronix Klipkit (optional, see "Replaceable Parts"), (useable on all options except option 25) provides a hands-off connection of signal and ground to an IC (up to 16 pins). Klipkit ground is acquired by inserting a connecting pin (included) into the Klipkit at the proper pin location. The probe body, with the ribbed shell tip removed, will then make ground contact when inserted into the other contact locations.

Figure 5. Methods Of Reducing The Effect Of Ground-Lead Inductance.

# P6133 SERVICE INFORMATION

## WARNING

*The following servicing instructions are for use by qualified personnel only. To avoid electric shock, do not disassemble the probe or perform any probe maintenance while the probe is connected to a signal source.*

**Table 1**  
**Test Equipment Required**

Item Number and Description	Minimum Specification	Example of Test Equipment
1. Oscilloscope	Input Resistance: $1 M\Omega \pm 0.5\%$ Input Capacitance: $10 pF - 25 pF$ Bandwidth (-3dB): 150 MHz.	Tektronix , 2445A or 2430A.
2. Calibration Generator	Pulse risetime: < 1 ns Amplitude: 0.5 V into $50 \Omega$ Rep rate: 100 kHz.	Tektronix PG506.
3. Leveled Sine-Wave Generator.	Amplitude adjustable up to at least 1V p-p into $50 \Omega$ , Frequency range must exceed 150 MHz, fixed 50 KHz ref.	Tektronix SG503.
4. Precision Coaxial	$50 \Omega$ , 36 inch, BNC.	Tektronix Part Number: 012-0482-00.
5. 10X Attenuator	$50 \Omega$ , BNC.	Tektronix Part Number: 011-0059-02.
6. Adapters	For Subminiature tips use: Subminiature-to-GR, $50 \Omega$ terminated BNC-to-GR.	Tektronix Part Number: 017-0063-00, 017-0520-00.
	For Compact tips use: Compact-to-BNC, $50 \Omega$ terminated BNC-Female-to-BNC-Female.	Tektronix Part Number: 013-0227-00 103-0028-00.
7. Low Reactance Adjustment Tool	Insulated, low reactance.	Tektronix Part Number: 003-1364-00, 003-1364-01.

## Adjustment Procedure

Refer to Table 1 for equipment requirements.

### 1. Adjust Low-Frequency Compensation.

a. Connect the P6133 to the oscilloscope CH 1 input. Set oscilloscope controls for 100 mV (includes probe 10X attenuation), 1 ms and DC coupling. Connect the probe input (using the hook-tip) to the oscilloscope CALIBRATOR output. Set the triggering controls for a stable display, approximately 5 cycles of square wave, and an amplitude of 4 divisions (centered on the screen).

b. ADJUST—Low-Frequency compensation (LF COMP) using a low-reactance non-conductive adjustment tool for the squarest waveform front corner. See Figure 6. Disconnect the test setup.

### 2. Check/Adjust High-Frequency Compensation.

a. Connect the positive fast rise output of the calibration generator, through the BNC cable and the 10X attenuator to the oscilloscope CH 1 input. Set the oscilloscope controls for 10 mV and 20 ns,  $50 \Omega$  DC coupling. Adjust the pulse amplitude to produce a 5-division display on the oscilloscope. Set the triggering controls for a stable display and center the display. Note the system aberrations for comparison in part b.

b. Remove the 10X attenuator from the oscilloscope input and the calibration generator. Connect the probe to the oscilloscope CH 1 input. Connect the probe tip through the probe-tip-to-BNC  $50 \Omega$  adapter and the female BNC-to-BNC adapter (or the BNC-to-GR and the  $50 \Omega$  GR-to-probe tip adapter) to the positive fastrise output of the calibration generator. Set the oscilloscope coupling to the  $1 M\Omega$  DC position. Check high frequency aberrations in the first 30 ns (in addition to system aberrations noted in part 2a). If probe aberrations are excessive, (typically  $\leq \pm 4\%$ , 6% p-p) proceed to part 2c. If they are not, proceed with part d.

c. To remove the plastic cover from the probe compensation box, first disconnect the probe from the signal source and the oscilloscope. Unscrew the compensation box retainer nut about two complete turns and lift the cover out and up, then re-tighten the retainer. Reconnect the probe (as in part 2b). See Figure 6 for the location of all adjustments, and Figure 7 for identification of the waveform area affected by each adjustment. ADJUST R1 for best overall flat response. ADJUST R2 for best corner response. The high-frequency adjustments affect the probe bandwidth. A small overshoot on the leading edge of the pulse may be necessary to meet the bandwidth specification. Reinstall the compensation box cover by reversing the procedure described above.

d. Disconnect the test setup.

### 3. Bandwidth Check.

Connect the P6133 probe output to the oscilloscope CH 1 input. Connect the probe tip through the  $50\ \Omega$  adapters and BNC cable (used in part 2b), to the output of the Leveled Sine Wave Generator described in Table 1. Set the oscilloscope controls for 100 mV (includes probe 10X attenuation), 1 ms, and  $1\ M\Omega$  DC coupling. Set the leveled sinewave generator frequency to 50 kHz. Adjust the generator output amplitude to produce a 6-division display on the oscilloscope. Center the display on the screen. Set the generator frequency-range switch to the high-frequency position and slowly increase the setting of the variable frequency control until the display amplitude decreases to 4.2 divisions (-3dB). Check the sine-wave generator frequency readout. The frequency must be greater than or equal to the P6133's specified system bandwidth. If the reading is less than the required value, repeat the adjustments in part 2.

## Maintenance

**Cleaning.** Accumulated dirt can be removed with a soft cloth dampened with a nonresidue type cleaner, preferably isopropyl alcohol. Before using any other type of cleaner, consult your Tektronix Service Center or representative. In particular, avoid benzene, toluene, xylene, acetone, or similar solvents.

**Probe Module Replacement.** Modular construction has been used to simplify repair. The probe tip assembly, compensation box, and cable are available as separate units through your local Tektronix Field Office or representative. Individual components within the compensation box are not replaceable. The probe tip assembly unscrews from the probe head/cable assembly. To disconnect the cable from the compensation box, unscrew the compensation box retainer nut about two complete turns and pull out the cable until it separates from the compensation box. Reconnect the cable to the compensation box by reversing the procedure described above.
