## Instructions STANDARD OP AMPL CARD <br> 013-0149-02

## SECTION 1

## DESCRIPTION

The Standard Operational Amplifier Card is a test card for use with the TEKTRONIX 178 Linear Test Fixture and is supplied with the 178 Linear Test Fixture.

The following is a description of each of the features of the card illustrated by Fig. 1-1. The number in brackets, [ ], indicates the portion of the figure being considered.

Fig. 1-1. Standard Operational Amplifier.
[1] This is a universal mating connector into which several types of device under test (DUT) sockets may be plugged, using the Amphenol-Barnes adapter system. The adapter system accommodates most of the package configurations (TO-5, DIP, flat pack, etc.). Also available are ZERO INSERTION sockets for 14and 16-lead dual-in-line packages from Textool Products, Inc., 1410 W. Pioneer Drive, Irving, Texas, 75061. (Order ZIP DIP ADAPTER, 216-2812-0-061 for 16-lead dual-in-line packages, and ZIP DIP ADAPTER, 214-2665-0-061 for 14-lead dual-in-line packages.)
[2] Connections from the adapter system are made via patch cords to the test circuits, [3].
[3] The 178 test circuits for the DUT are brought out to pin jacks within this area.

Each operational amplifier terminal is connected to pin jack. For example, the output is labeled OUT, and consists of three pin jacks. This allows for more than one patch cord or component to be connected to the OUT jack. Similarly, the pin jacks connecting to the DUT's differential inputs are labeled + IN and $-\operatorname{IN}$. Each of the inputs consists of two pin jacks. The same for the DUT supplies, the positive supply labeled $\mathrm{V}+$ and negative supply labeled $V$-. Each consists of two pin jacks.
[4] An external feedback amplifier (EXT FBA) is provided for additional closed loop gain, phase shift control, and other circuit applications when needed. The EXT FBA may be added to the closed loop test configuration by the switch shown in Fig. 1-2. This added gain can be useful for testing low gain amplifiers, for example, in a test function such as CMRR or PSRR, where the DUT's output voltage should be held at zero volts. In these functions, the EXT FBA maintains the DUT's output closer to zero volts than would be possible if the loop gain were provided by only a low-gain DUT. If the output of a low-gain DUT is not held close to zero volts, an error signal appears at the input.

Fig. 1-2. External feedback amplifier and switch.

This error signal caused by low gain adds to the input signal during CMRR or PSRR and produces an erroneous measurement. With a high gain DUT, the error signal is directly reduced because a smaller signal is required at the input for a given output signal.

As a rule of thumb, this low DUT gain may cause significant measurement error when measuring CMRR and PSRR, if those parameters are 20 dB or more below the DUT gain. The EXT FBA has a gain of 40 dB , which is sufficient for most low gain, high CMRR-PSRR devices. This gain may be retailored if desired by the user.

For phase control, the LM301 is compensated with a 1000 pF capacitor for a first pole of $<0.1 \mathrm{~Hz}$, giving the EXT FBA a unity-gain bandwidth of $\leqslant 10 \mathrm{kHz}$.

The DUT will oscillate if a second pole in the system feedback loop occurs before system unity gain bandwidth is reached. Therefore, if the DUT has unity gain bandwidth much greater than the 178 gain bandwidth, the LM301 can be used to control the system gain bandwidth. To accomplish this system gain bandwidth control, increase the size of the LM301 compensating capacitor, C, on the Standard Operational Amplifier Card. If the DUT has compensating terminals, compensate the DUT for unity-gain bandwidth to stop oscillations, and do not use the EXT FBA.

With the EXT FBA switch in the NORM position, the EXT FBA may be used for other applications (e.g., EXT FBA can be patched into input, output, or power supply circuits to provide offset, power supply, buffer amplifier, common-mode amplifier, phase control, etc.).
[5] Two variable resistors, - I Limit and + I Limit, can be set to limit the DUT supply current; see 178 manual. These variable resistors may be removed and a $1 / 4 \mathrm{~W}$ resistor connected between the center solder pad under each variable resistor and the solder pad approximately $1 / 2$ inch to the left of each of the variable resistors. Placing a wire between the solder pads permits the DUT supplies to provide a minimum of 150 mA for each supply. Inserting $50 \Omega$ resistors will provide approximately 15 mA for each supply. The solder pads $1 / 2$ inch to the left of the variable resistors are +40 V unregulated supply, upper solder pad, and -40 V unregulated supply, lower solder pad. The maximum available current is 175 mA , but the sum of the +40 V and +30 V supply currents should not exceed 185 mA (see [11]). The DUT supply current is considered as part of the 40 V supply. The same restrictions apply to the -40 V supply.
[6] Jacks STEP and CS provide access to the 577 Step Generator and Collector Supply. EXT connects to the 178 Ext Signal In jack (178 front panel). EXT is provided to allow an external power supply, sweep generator, DMM, or other test equipment to be connected into the DUT test circuits.

Kelvin sensing is provided for the collector sweep. Open the run on the back side of the board (see Fig. 1-3). Patch from the solder pad directly to the DUT terminal.

Kelvin sensing is provided for the return path. Open the run on the front side of the board (see Fig. 1-4). Patch from the solder pad shown, directly to the ground terminal of the DUT.

Fig. 1-3. Breakpoint for collector sweep Kelvin sensing run. The solder pad is to the left on the run.

Fig. 1-4. Breakpoint for Kelvin sensing return path. The solder pad is to the left on the run.
[7] $R_{L}$ EXT provides the means to connect an external load resistor to the DUT output. The jack at the right end of $R_{L}$ EXT is connected to the OUT jack when the Load Resistance switch on the 178 is in the Ext position. The left end of $R_{L}$ EXT is grounded when the 178 Function switch is in the Offset V, Gain, or Collector Supply I position. The external load resistance is always in parallel with a $50 \mathrm{k} \Omega$ resistor.
$-R_{S}$ EXT and $+R_{S}$ EXT provide values of source resistance other than those selected by the 178 Source resistance switch (switch to Ext position). The right ends of pin jacks $+\mathrm{R}_{\mathrm{s}}$ EXT and $-\mathrm{R}_{\mathrm{s}}$ EXT are connected to the $\mathbb{N}$ jacks (with the Source Resistance switch to the $50 \Omega$ position). If the Source Resistance switch is in a position other than $50 \Omega$, the resistance selected is between the right end of $R_{S}$ EXT and the DUT terminal. In the EXT position of the Source Resistance switch, the left end of $R_{s}$ EXT (pin jack) connects to the Input terminal.
[8] Sets of pin jacks are provided to patch additional components into the test circuits. Also, a hole in the front panel is provided to mount a variable resistor for making offset range and other tests.
[9] The $5 \mathrm{k} \Omega$ Input terminal is used to offset the output terminal voltage for devices that require the output at some voltage other than ground. The $5 \mathrm{k} \Omega$ input voltage must be of the opposite polarity and be one-tenth of the desired output voltage. Generally, the Step Generator can be used in the Offset voltage mode to provide this voltage.

The $50 \mathrm{k} \Omega$ input terminal is used the same as the $5 \mathrm{k} \Omega$ input. The offset voltage must be of the opposite polarity and equal to the desired voltage. The $50 \mathrm{k} \Omega$ input is grounded when not used, to reduce noise in the 178. A run between the pin jack and ground must be opened to use this input. Resolder the run when this input is not being used. See Fig. 1-5 for location of solder pad and run.
[10] S/H output provides a direct output from the sample and hold in position (tests) 2 through 11 of the 178 Function switch. It is connected to the top of the + Input attenuator in all tests. In test 4, maximum current output is 1 mA . In all other tests, maximum current output is approximately 6 mA . The voltage compliance is approximately 24 V . Caution should be taken not to short the $\mathrm{S} / \mathrm{H}$ output, as it may destroy the op-amp in the 178. The user should have a good understanding of the $\mathrm{S} / \mathrm{H}$ circuit before attempting to use this circuit. See the circuit description and diagrams in the 178 manual.
[11] +30 V and -30 V regulated supplies are provided to operate additional circuitry if needed. Maximum available current is 50 mA for each supply; but the sum of the +30 V and +40 V supply currents should not exceed 185 mA and the -30 V and -40 V supply currents should not exceed 185 mA (see [5]).

Fig. 1-5. Breakpoint for $50 \mathrm{k} \Omega$ Input run. The pin jack is below the breakpoint.

## REPLACEABLE PARTS

## PARTS ORDERING INFORMATION

Replacement parts are available from or through your local Tektronix. Inc. Field Office or representative.

Changes to Tektronix instruments are sometimes made to accommodate improved components as they become available, and to give you the benefit of the latest circuit improvements developed in our engineering department. It is therefore important. when ordering parts. to include the following information in your order: Part number, instrument type or number, serial number, and modification number if applicable.

If a part you have ordered has been replaced with a new or improved part. your local Tektronix. Inc. Field Office or representative will contact you concerning any change in part number.

Change information, if any, is located at the rear of this manual.

## SPECIAL NOTES AND SYMBOLS

X000 Part first added at this serial number
00X Part removed after this serial number

## FIGURE AND INDEX NUMBERS

Items in this section are referenced by figure and index numbers to the illustrations.

## INDENTATION SYSTEM

This mechanical parts list is indented to indicate item relationships. Following is an example of the indentation system used in the description column.

```
1234 Name & Description
Assembly and/or Component
Attaching parts for Assembly and/or Component
            .......
    Detail Part of Assembly and/or Component
    Aftaching parts for Detail Part
    ....*...
    Parts of Detail Part
    Attaching parts for Parts of Detail Part
```

Attaching Parts always appear in the same indentation as the item it mounts. while the detail parts are indented to the right. Indented items are part of, and included with, the next higher indentation. The separation symbol-..* --- indicates the end of attaching parts.

Attaching parts must be purchased separately, unless otherwise epecified.

## ITEM NAME

In the Parts List, an litem Name is separated from the description by a colon (i). Because of space limitations, an Item Name may sometimes appear as incomplete. For further Item Name identification, the U.S. Federal Cataloging Handbook H6-1 can be utilized where possible.
